Executive Summary

Section 1: Introduction

1.1 Purpose of the Plan

The Executive Office of Energy and Environmental Affairs (EEA), the Massachusetts Emergency Management Agency (MEMA) and the Drought Management Task Force (DMTF) have developed the Massachusetts Drought Management Plan (DMP) to maximize the state's ability to effectively prepare for and respond to drought conditions.

Specifically, the plan aims to minimize drought impacts to the Commonwealth by improving agency coordination; enhancing monitoring and early drought warning capabilities; and outlining preparedness, response, and recovery activities for state agencies, local communities, and other entities affected by drought. The plan lays out an integrated, multi-agency approach to managing drought, with an emphasis on state-led preparedness and response actions as drought conditions change. Critical new and updated elements provided by the plan include:

- Defining a clear methodology for monitoring and analyzing drought indices and establishing a consistent basis for evaluating the severity of drought conditions;
- Assessing the impacts on various sectors, including the environment;
- Outlining a drought communications plan;
- Establishing membership and responsibilities of the Drought Management Task Force;
- Identifying and assigning drought management roles and responsibilities and providing response guidance and actions for each drought level;
- Providing guidance to communities on drought preparedness and response actions at the local level; and
- Summarizing the emergency powers available to government agencies to respond to drought situations.

The Massachusetts Drought Management Plan is a Hazard Annex under the Massachusetts Comprehensive Emergency Management Plan (CEMP).

1.2 Scope and Applicability

This plan represents a systematic and scientific approach to drought analysis, assessment of impacts, and coordination of actions. The assessment of conditions is statewide, and determinations on the severity level of drought are made for each of seven drought regions across the state (see Figure 1). Drought declarations may also be made on other spatial delineations such as counties or watersheds. Coordination and drought mitigation actions outlined in the Plan are applicable to state agencies; local government; agricultural, industrial, commercial and institutional water users; and all residents of the Commonwealth.

The plan documents how the state determines when a drought begins and establishes the drought levels. It also specifies the responsibilities of state agencies in response to drought, including the lines

of communication to be used, the general sequence of actions to be followed at the state and local level based on the severity of the drought condition, and the emergency powers available to local and state government agencies and the Governor. The plan also offers guidance on critical drought preparedness actions at the state and local level.

The state agencies and departments that are assigned responsibilities within this Plan will develop and maintain the necessary protocols, standard operating procedures, and mutual-aid agreements to successfully accomplish assigned tasks. This Plan is designed to supplement and support existing local comprehensive emergency management plans and, therefore, builds upon established capabilities at the local level.

Nothing contained in this Plan should be construed to limit the powers of local government to adopt and enforce local emergency bylaws or ordinances as necessary to protect the public welfare, safety, and health.

1.3 Background

1.3.1 Massachusetts' Climate - Past, Present and Future

Massachusetts is located on the eastern edge of the North American continent. This, coupled with its northerly latitude, exposes the state to both the moderating and moistening influence of the Atlantic Ocean, and the effects of hot and cold air masses from the interior of the continent. Its climate is characterized by cold, snowy winters and warm summers. The polar jet stream is often located near the state, giving it highly variable weather patterns, wide-ranging daily and annual temperatures, and generally abundant precipitation throughout the year.¹

Massachusetts' annual precipitation is variable from year to year. Average annual precipitation is 48 inches per year, ranging from 30 to 61 inches in the driest and wettest years, respectively. Precipitation is generally spread fairly evenly across the months, with approximately 3- to 4-inch average amounts for each month of the year. The driest conditions in recorded history were observed in the early 1900s and again in the 1960s, with wetter conditions occurring since the 1970s. The driest five-year period was 1962-1966.

According to Runkle et. al. (2017), annual precipitation in Massachusetts has been increasing in recent decades and is expected to rise further as a result of climate change. In addition, the frequency of extreme precipitation events is on the rise and projected to more than double by the end of the 21st century. This is likely to result in increased coastal and inland flooding risks, including substantial increases in riverine flooding by 2050. Large storms add significantly to monthly and annual precipitation totals but unlike a similar amount of precipitation falling in multiple, smaller storms, they do not translate to significant groundwater replenishment or steady streamflows.

¹ Runkle, J., K. Kunkel, R. Frankson, D. Easterling, A.T. DeGaetano, B. Stewart, and W. Sweet, 2017: Massachusetts State Climate Summary. NOAA Technical Report NESDIS 149-MA, 4 pp.

Additionally, increased evaporation from warmer temperatures, alterations in the timing and magnitude of streamflow following reductions in snowpack, as well as changes in the amount, timing, and type of precipitation, may intensify naturally occurring droughts.

1.3.2 Drought Impacts

Drought can be characterized as a dry (moisture-deficient) condition that is a shift away from average conditions for some prolonged period of time. Drought can have incrementally worse impacts on a wide range of natural and anthropogenic systems. Prolonged periods of below-normal or no rainfall can impact streamflow, fisheries and other aquatic habitat; water supply from reservoirs and wells, agriculture, and wastewater flows; including minimum flows required to maintain wastewater permit conditions. Another significant impact of dry conditions is fire danger and the ability to have enough water supply and/or pressure required in a water supply system for adequate fire protection. Long-term droughts will typically affect water supplies that rely on reservoir storage, and have more significant impacts on habitats and fisheries populations.

1.3.3 History of Drought in Massachusetts

Massachusetts is a relatively water-rich state. However, it has suffered several major statewide droughts during the course of the last century. The most severe occurred in 1929-1932, 1939-1944, 1961-1969, 1980-1983, and 2016-2017. Several less severe droughts have also occurred; some notable ones in recent history occurred in 1999, 2001, 2002, 2007, 2008, 2010, and 2014. See Appendix J for a summary table. The nine-year drought from 1961-1969 is the most severe on record. Because of the longevity of this drought, water-use restrictions were instituted and numerous communities utilized emergency water supplies. Thirty-seven communities had emergency declarations for water supply, ten communities had water supply in a critical condition with either restricted pumping or less than 90 days' worth of supply, and the Quabbin Reservoir, the state's largest, dropped to 45% of its capacity (Wandle, 1991).

Drought is historically a slowly developing – and often long-lasting – event with cumulative impacts. However, the most recent 2016-2017 drought was characterized by a rapid decline in conditions from one month to the next, fitting the recently introduced concept of a “flash drought”². The 2016-2017 drought was the most significant drought since the 1960s. The NWS reported rainfall was well below average, down to the mid-30 inches each year. In many parts of the state, USGS data for streamflow and groundwater reached new record low levels for several consecutive months.

1.3.4 History of the Drought Plan

The Massachusetts Drought Management Plan was initially developed in the early 2000s in response to a period of precipitation deficiency from April 1999 to March 2000. State and federal agencies met in August 1999 as an ad-hoc Drought Management Task Force (DMTF) to assess drought conditions and develop recommendations to the Secretary of Environmental Affairs on the level of drought and

² Otkin et al 2018. <https://journals.ametsoc.org/doi/pdf/10.1175/BAMS-D-17-0149.1>

to the agencies on drought responses. The group continued to meet to develop a Drought Management Plan with standard procedures to help facilitate responses to current and future situations. The Drought Management Plan was developed in 2001 as a working document, and the methods outlined in the plan have been applied several times since then. In 2013, the plan underwent minor updates and was formally adopted by the DMTF.

During the 2016-2017 drought the 2013 plan was used and implemented, and many lessons were learned, resulting in this update. In revising this plan, the DMTF and state agencies conducted an in-depth review of all the indices, including how they are monitored, analyzed and applied; reexamined the boundaries of the drought regions; reviewed and researched effective preparedness and response actions; and undertook a broader review of communication pathways. This resulted in an adjustment to the boundaries of some drought regions; an introduction of a new 'Islands' region; the removal of 'percent of normal' precipitation as an index; a change to the look back periods for the Standard Precipitation Index; a change in nomenclature of the 'reservoir' index to 'lakes and impoundments'; a change in methodology for calculating the indices and for calculating the thresholds for drought levels; the introduction of new and substantially updated actions for local and state government; and updated communication actions. Details about the analyses conducted, and changes made to the indices are detailed in Appendix D.

Section 2: Authority and Coordination

2.1 EEA and MEMA

EEA, in coordination with MEMA, is responsible for overall coordination of this Plan. During a drought, EEA and MEMA will coordinate to provide overall support and situational awareness regarding coordination of the state response to areas of the Commonwealth impacted by drought. Specifically, EEA is responsible for overall coordination of all environmental agencies and carries out its tasks with the assistance of Massachusetts Water Resources Commission staff housed at the Department of Conservation and Recreation. EEA coordinates closely with the Governor's office, plans and implements communication with the public, and leads and oversees drought response across the state. MEMA is responsible for coordinating any additional resources necessary to support drought response efforts across the Commonwealth, including additional federal, state, local, voluntary and private resources.

Together, EEA and MEMA:

- Convene the DMTF, including establishing its agendas and facilitating its meetings;
- Collect and disseminate data on the status of the drought;
- Prepare DMTF meeting summaries;
- Coordinate communications among government agencies;
- Communicate DMTF's recommendations on the level of drought for each region;
- Coordinate federal assistance, as needed;
- Advise on communications with the general public; and

- Forward recommendations to the appropriate entities.

2.2 Drought Management Task Force

2.2.1 Composition

The Drought Management Task Force (DMTF) consists of representatives of state and federal agencies – such as environmental agencies, public health officials, and public safety officials – that provide data related to assessing drought and weather conditions and have the ability to assess impacts to various resources and water users and respond to drought conditions. It also includes professional organizations that have responsibility for areas likely to be affected by drought conditions.

The DMTF is housed at EEA and is co-chaired by the Director of Water Policy at EEA and the Director of MEMA or a designee. All DMTF related activities and matters are directed and managed by the Director of Water Policy. The Department of Conservation and Recreation’s Office of Water Resources, staff to the Massachusetts Water Resources Commission, provides technical and planning support to the DMTF.

The DMTF has representatives from the following agencies and organizations:

- Executive Office of Energy and Environmental Affairs (co-chair)
- Massachusetts Emergency Management Agency (co-chair)
- Department of Conservation and Recreation
- Department of Environmental Protection
- Department of Fish and Game
- Department of Agricultural Resources
- Department of Public Health
- Department of Public Utilities
- Department of Fire Services (within the Executive Office of Public Safety and Security)
- Massachusetts Association of Health Boards
- Massachusetts Water Resources Authority
- United States Geological Survey
- National Weather Service
- Northeast River Forecast Center, National Weather Service
- U.S. Army Corps of Engineers
- Farm Services Agency, U.S. Department of Agriculture
- Massachusetts Water Works Association
- Water Supply Citizens Advisory Committee

Appendix C provides a contact list for Task Force members.

2.2.2 Purpose and Responsibilities

The DMTF provides a comprehensive assessment of the drought situation based on an analysis of the drought indices, near-term forecast of precipitation and temperature, other information about

specific impacts as available, and best professional judgement. The DMTF recommends drought levels for each region of the Commonwealth to the Secretary of EEA, facilitates communication and situational awareness through EEA with the Governor's Office, the Secretary of Public Safety and Security, or others as needed, and uses the plan to identify recommendations on potential response actions to minimize impacts to public health, safety, the environment, and agriculture. In the event of a severe drought, the DMTF makes recommendations for declaring emergencies and for developing and implementing emergency responses.

Additional DMTF responsibilities include:

- Developing and updating the Massachusetts Drought Management Plan;
- Identifying and providing general oversight of drought response actions;
- Identifying drought management trends, issues and gaps; and
- Documenting and sharing lessons from drought events.

Implementation of the DMTF-recommended response actions is the responsibility of the appropriate agency or entity based on its jurisdiction or expertise. MEMA and EEA will forward recommendations through the appropriate chain(s) of command and follow up with the responsible agencies to ensure the successful implementation of DMP and Task Force recommendations.

The DMTF is not intended to infringe upon the statutory or other obligations of its member agencies or of others who are responsible for responding to any particular situation, but rather to ensure there is a coordinated response by state and federal agencies to drought situations.

2.3 Drought Management Mission Group

To effectively coordinate and execute response actions by state agencies and other entities, an interagency Drought Management Mission Group will be formed to assess drought impacts and prioritize response actions at all levels of government. This coordinating body comprises staff assigned by agency commissioners or directors from MEMA, DEP, DCR, DAR, DPH, and other agencies as needed and is formed when a drought reaches Level 2-Significant Drought. The EEA Director of Water Policy and Director of MEMA (or designee) will lead the Mission Group. The Mission Group will meet on a periodic basis with greater frequency than the DMTF and update the DMTF on response actions through agency representatives on the DMTF.

2.4 State and Federal Support Agencies

Many state and federal agencies serve directly on the DMTF providing data, analyses, impact reports, expert advice, and recommendations on drought determinations and response actions. These agencies have roles and responsibilities under this plan, as described in Section 6 and summarized in Table 1.

Table 1. Responsibilities of State and Federal Agencies

Agency	Responsibilities
Department of Agricultural Resources	<ul style="list-style-type: none"> ▪ Monitor and report on crop moisture status and agricultural impacts from drought, in coordination with UMass Extension ▪ Communicate with USDA for federal assistance, as appropriate ▪ Communicate with agricultural community about available aid and provide technical assistance
Department of Conservation and Recreation	<p>Office of Water Resources</p> <ul style="list-style-type: none"> ▪ Manage the state’s network of precipitation observation stations and a precipitation database ▪ Coordinate, collect, and analyze data to deliver monthly reports on six drought indices ▪ Assist in DMTF meeting preparation and follow up <p>Forestry</p> <ul style="list-style-type: none"> ▪ Monitor and report on level of fire danger in each drought region ▪ Manage state fire suppression resources ▪ Coordinate with local, state, federal agencies, and other states to mobilize resources, as needed. <p>Engineering and Dam Safety</p> <ul style="list-style-type: none"> ▪ Assess conditions and report on Charles and Mystic flood control dams ▪ Report on other critical DCR infrastructure
Department of Environmental Protection	<ul style="list-style-type: none"> ▪ Provide list of communities with mandatory water bans and declared water emergencies ▪ Declare water emergencies for communities facing public health or safety threats due to drought impacts to their water supply systems ▪ Provide information on public water supplies, drinking water quality, water pressure or public health concerns associated with drinking water supplies ▪ Coordinate with local Boards of Health
Department of Fire Services	<ul style="list-style-type: none"> ▪ Provide guidance and support on pre-planning, risk assessment and Fire Code requirements relating to water supplies for fire-fighting purposes.
Department of Fish and Game	<ul style="list-style-type: none"> ▪ Monitor and report on impacts to coastal and inland ecosystems, flora and fauna
Department of Public Health	<ul style="list-style-type: none"> ▪ Summarize any public health issues related to drought such as impacts to private wells, beaches, lakes and ponds, etc. ▪ Coordinate with local Boards of Health
Department of Public Utilities	<ul style="list-style-type: none"> ▪ Summarize impacts to private well companies and other public utility issues
National Weather Service	<ul style="list-style-type: none"> ▪ Provide summary of precipitation data, historical comparisons, and forecasts of weather and riverine conditions
United States Geological Survey	<ul style="list-style-type: none"> ▪ Provide summary of groundwater, streamflow and surface water conditions

Section 3: Drought Assessment and Determination

3.1 Drought Levels

For the purposes of this Plan, conditions are classified into five levels- a normal condition and four drought severity levels. These levels are based on six drought indices, observed impacts to various resources and forecasts, as described in detail in Sections 3.3 to 3.4. The condition levels are: ‘Level 0-Normal i.e. No Drought’, ‘Level 1-Mild Drought’ (formerly Advisory), ‘Level 2-Significant Drought’ (formerly Watch), ‘Level 3-Critical Drought’ (formerly Warning), and ‘Level 4-Emergency Drought’ (formerly Emergency). These levels were selected to provide distinction between different levels of drought severity and for adequate warning of worsening drought conditions.

- Level 0 - Normal
- Level 1 - Mild Drought
- Level 2 - Significant Drought
- Level 3 - Critical Drought
- Level 4 - Emergency Drought

3.2 Drought Regions

Regions across the Commonwealth differ in precipitation patterns, topography, land use, population density, and other factors that affect drought propensity and intensity. This Plan delineates seven Drought Regions to allow flexibility and customization of drought declarations and response actions for different areas within the Commonwealth. The Drought Regions represent broad geographic areas, originally based on precipitation patterns, which have been refined along their boundaries to align with county boundaries. County alignment facilitates more streamlined communication and response when droughts occur.

Table 2 shows the counties corresponding to each of the seven regions. Figure 1 shows drought regions and counties on a map. For a list of towns by drought region, go to Appendix E.

Table 2. Counties within Each Drought Region

Drought Region	County(ies)
Western	Berkshire
Connecticut River Valley	Franklin, Hampshire and Hampden
Central	Worcester
Northeast	Essex, Middlesex and Suffolk counties, plus Brookline
Southeast	Norfolk (minus Brookline), Bristol and Plymouth counties
Cape Cod	Barnstable county
Islands	Nantucket and Dukes (includes Elizabeth Islands)

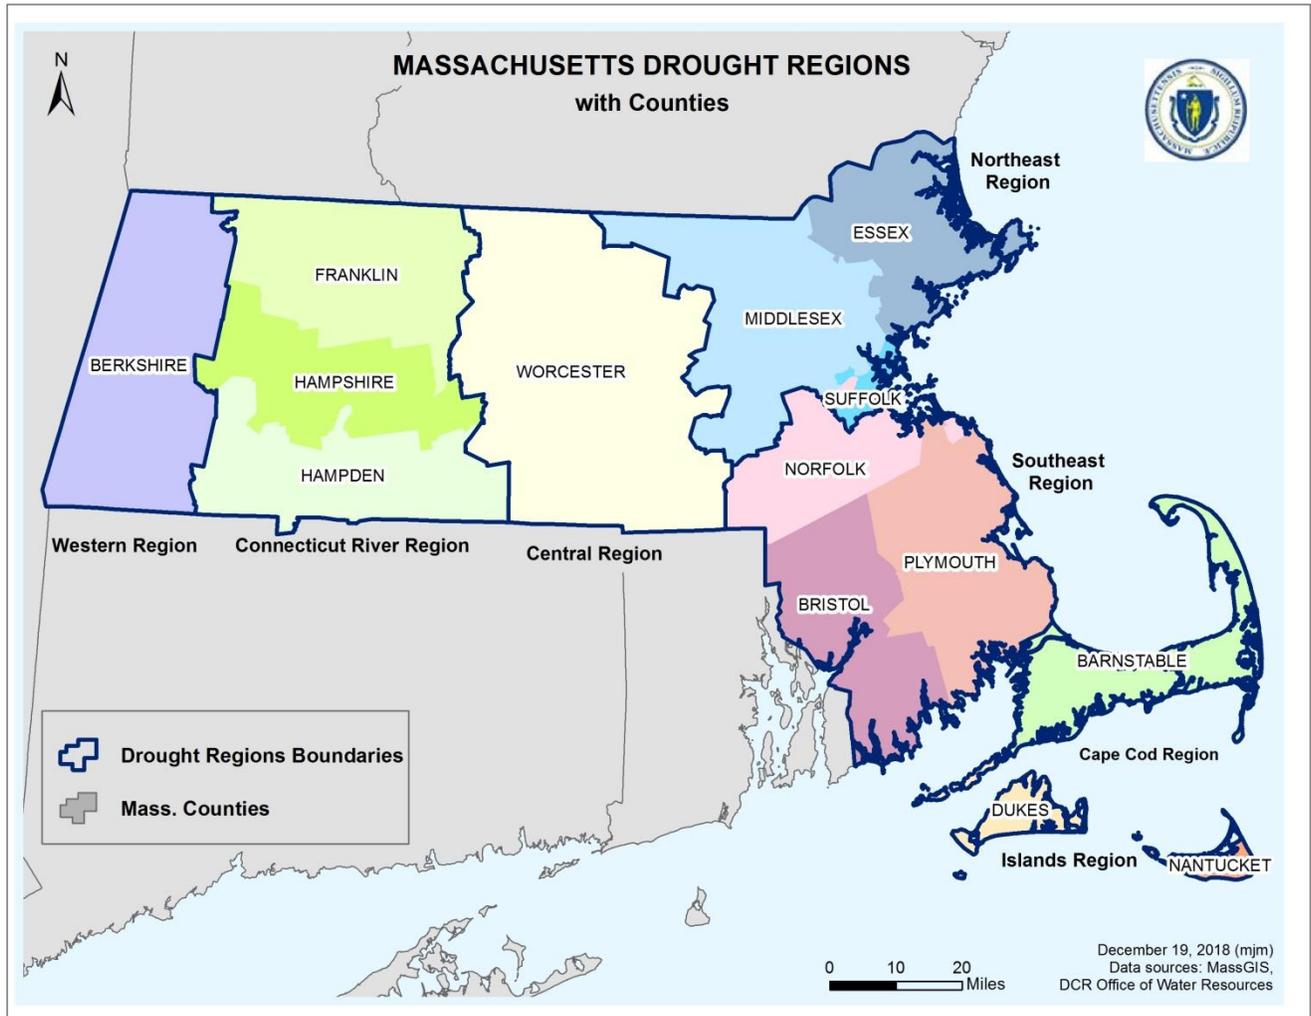

Figure 1: Massachusetts Drought Regions with Counties

During a drought, these regions may be adjusted based on the particular conditions of the drought. For example, drought analyses may be performed and declarations made on an individual county or watershed basis. This may be particularly useful if drier conditions exist within a watershed but not in the entire region(s) in which it is located. In addition, the Massachusetts Water Resources Authority (MWRA) water supply system which serves areas outside their watersheds may assess their water supply conditions based on the capacities of their system, in addition to the regional indices. Figure 2 shows a map with the major watersheds delineated.

3.3 Critical Information Requirements

Collecting pertinent data and monitoring trends in the data are vital to assessing the severity of drought conditions, assessing impacts to public health and the natural environment, and making timely, accurate decisions. Some data are compiled year-round by DCR's Office of Water Resources (OWR) staff into a monthly Hydrologic Conditions Report. This report summarizes the condition of water resources across the Commonwealth, including the calculation of six drought indices: Precipitation, Groundwater, Streamflow, Lakes and Impoundments, Evapotranspiration, and Fire Danger which are further described in Section 3.4. The report also includes weather forecasts.

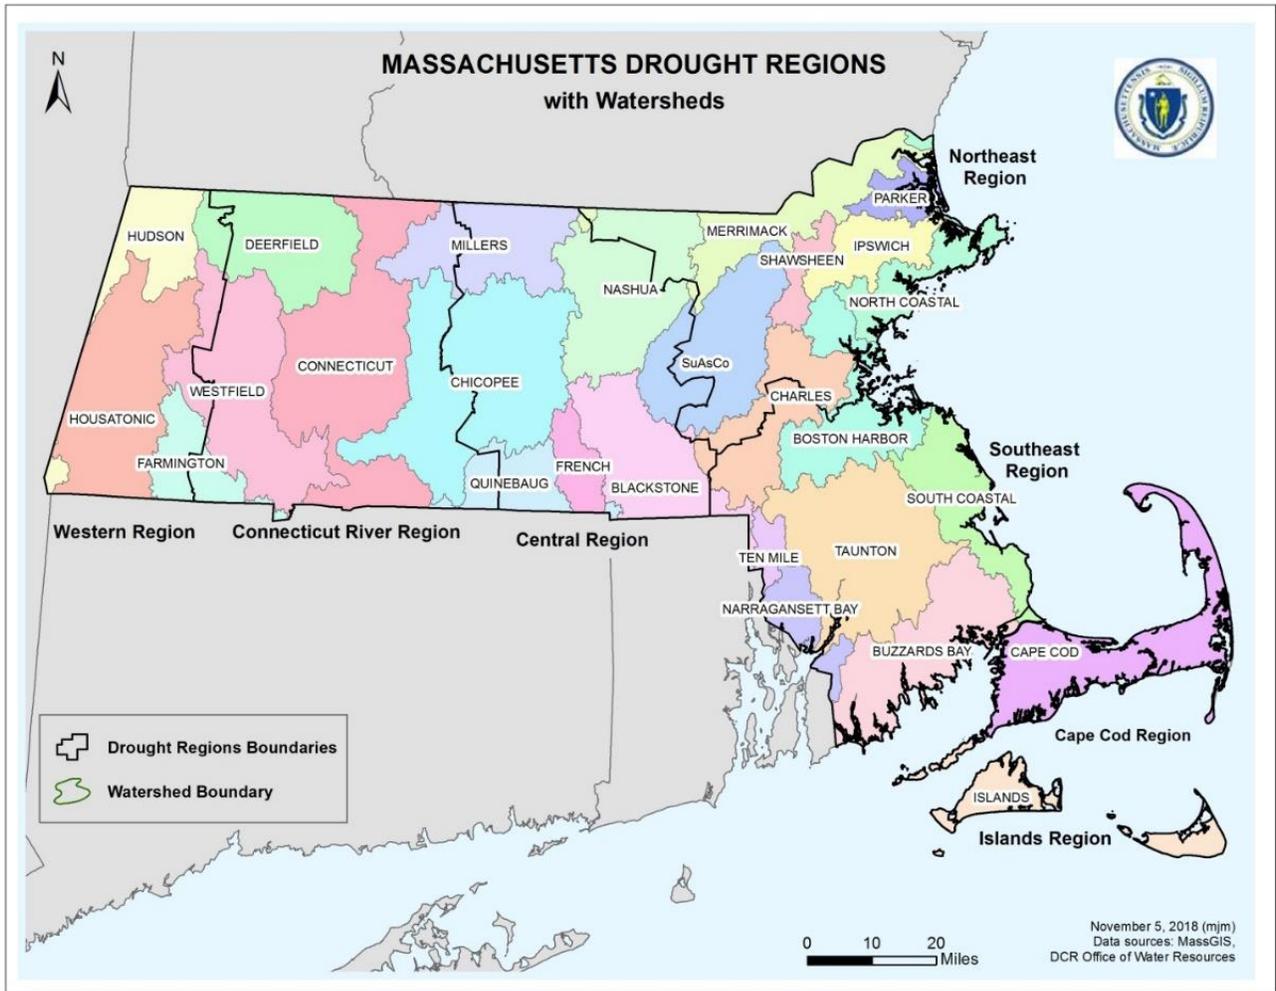

Figure 2: Massachusetts Drought Regions with Watersheds

When persistently dry conditions occur, agencies provide additional data to assist the DMTF in determining if a drought is imminent or occurring. Table 3 below details the data reported to the DMTF to assist with making a drought determination, and the agencies or organizations responsible for collecting and reporting the data to the DMTF.

3.4 Drought Indices

Six Drought Indices are used as the primary drivers of drought determinations, supplemented by the other considerations described in Table 3. The six indices are: 1) Precipitation, 2) Streamflow, 3) Groundwater, 4) Lakes and Impoundments, 5) Fire Danger, and 6) Evapotranspiration. This section describes the calculation of the six drought indices. First, background is provided on the methods (subsection 3.4.1) and then the calculations are detailed for each index in subsections 3.4.2 through 3.4.7.

Table 3. Critical Information and Agencies or Organizations Responsible for Reporting

Information	Agency or Organization
Groundwater levels, streamflow, and levels of lakes and impoundments	Department of Conservation and Recreation (DCR): Office of Water Resources (OWR) United States Geological Survey (USGS) United States Army Corps of Engineers (USACE)
Precipitation and temperature	DCR OWR National Weather Service (NWS)
Forecast and weather information	NWS USGS
List of communities with voluntary and mandatory water bans and declared water emergencies	Department of Environmental Protection (MassDEP)
Other drinking water quality, water pressure or public health concerns associated with drinking water supplies	MassDEP Department of Public Health (DPH) Massachusetts Water Works Association (MWWA)
Quabbin and Wachusett reservoir levels and status of MWRA communities' water supplies	DCR Massachusetts Water Resources Authority (MWRA)
Fire danger levels, forest fire conditions	DCR Bureau of Forest Fire Control and Forestry Department of Fire Services State Fire Marshal
Soil, crop, livestock and other agricultural conditions and impacts	Department of Agricultural Resources (DAR) United States Department of Agriculture (USDA) Farm Services Agency (FSA)
Public utility impacts	Department of Public Utilities (DPU)
Public health impacts	Department of Public Health (DPH) Massachusetts Association of Health Boards (MAHB)
Ecosystems, flora, and fauna impacts	Department of Fish and Game (DFG)
Other	As reported through the Drought Impact Reporter or other sources

3.4.1 Methods for Calculating Indices

The following describes the methods for calculating all indices, except the Fire Danger and Evapotranspiration Indices, for which the historical data required for the methods are not available. For a given index, measurements at multiple sites within a region are analyzed wherever available. For each site, the percentile of that month's measured value is calculated based on all other values for that month at that site over the period of record³. A percentile is a value on a scale of 0-100 that indicates the percent of a dataset that is equal to or below the value⁴. For example, a monthly average streamflow value at the 30th percentile is equal to or greater than 30 percent of the monthly average streamflow values for that site for that month during all the years in the period of record. Characterizing how unusual a given condition is at a given site in this manner follows methods of the USGS⁵ and the U.S. Drought Monitor⁶ and allows for useful comparisons among sites with different hydrologic characteristics. For a site to be included in the analysis, the site must have a period of record of at least ten years.

Conditions are then characterized at a regional scale by the median of all the individual sites' percentiles within that region. This median percentile is categorized as one of five index severity levels, based on the ranges shown in Table 4. The severity level for any index may be different from the overall regional drought level, which is a comprehensive assessment of all 6 indices. For example, if the median percentile value across the individual sites is 25, then the region is categorized as Level 1 for that index. If the median percentile is above 30, that index is classified as not exhibiting drought conditions (i.e., Level 0).

Table 4. Index Severity Levels and Associated Percentile Ranges

Index Severity Level	Percentile Ranges
0	>30
1	≤30 and >20
2	≤20 and >10
3	≤10 and >2
4	≤2

Index severity for a region may be adjusted from the calculations based on best professional judgement. For example, severity at a higher level may be recommended based on the number and duration of record lows measured at individual sites that are not sufficiently reflected in the

³ The POR is the time period over which data have been measured and made available for a dataset. For example, a stream gage that has measurements from January 1970 to December 2016 would have a 47-year period of record.

⁴ <https://waterwatch.usgs.gov/ptile.html>

⁵ <https://pubs.usgs.gov/twri/twri4a3/pdf/twri4a3-new.pdf>

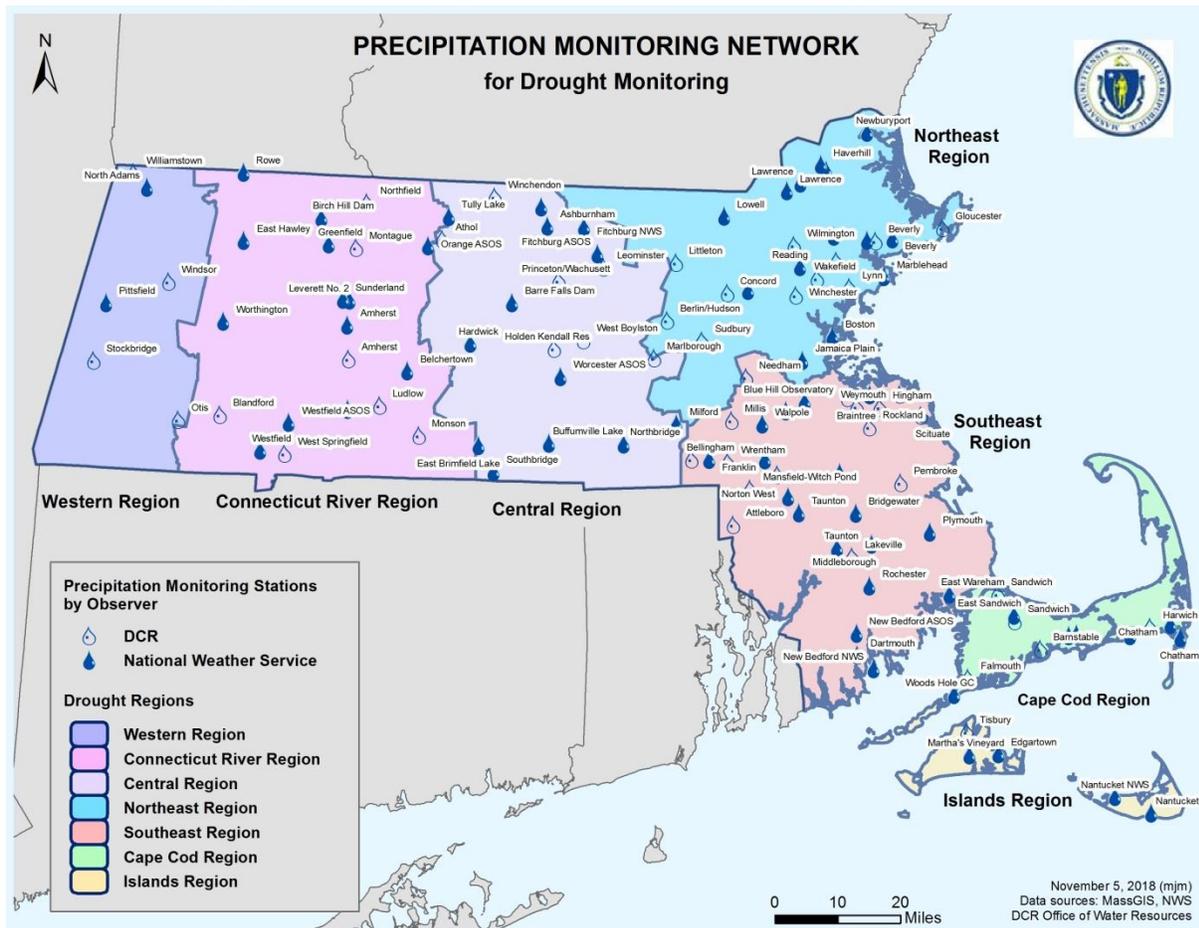

⁶ <http://droughtmonitor.unl.edu/AboutUSDM/DroughtClassification.aspx>

calculated regional median and resulting severity level. A summary table of index severity levels and corresponding values for all drought indices is presented in Appendix D.

3.4.2 Precipitation

Precipitation deficit is a primary driver of dry conditions. A deficit may be an early signal of drying conditions while a surplus during a drought may indicate the start of drought recovery.

For the calculation of this index, monthly precipitation totals are compiled from monitoring stations in DCR’s Precipitation Program and the NWS network. A map of these stations is provided in Figure 3. The values used for the Precipitation Index are the calculated Standardized Precipitation Index (SPI) values. The SPI is a widely used index that was developed to reflect the probability of a given precipitation depth occurring at a precipitation station over a given time period. SPI can be calculated for different time periods or “look-back” periods to monitor conditions on a variety of time scales. For a short-term drought signal, for example, the three-month SPI is calculated as the cumulative precipitation over the three most recent months compared to the cumulative precipitation for those same three months of the year over the period of record. The SPI values can be interpreted as the number of standard deviations by which the observed value deviates from the long-term mean. SPI values correspond to specific percentiles as shown in Table 5.

MA Figure 3: Massachusetts Precipitation Monitoring Network for Drought Monitoring

The following calculation steps are performed each month:

- 1) For each station,
 - a) Sum the precipitation (rain plus melted snow) over the month; and
 - b) Calculate the SPI value based on the period of record including the current month for the following look-back periods: 1, 2, 3, 6, 9, 12, 24 and 36 months.

Table 5. SPI Values Corresponding to Percentile Ranges

Severity Level	Percentile Ranges	SPI Values
0	>30	> -0.52
1	≤30 and >20	≤ -0.52 and > -0.84
2	≤20 and >10	≤ -0.84 and > -1.28
3	≤10 and >2	≤ -1.28 and > -2.05
4	≤2	≤ -2.05

- 2) For each drought region,
 - a) Calculate the median of the individual stations' SPI values for each look-back period;
 - b) Identify the percentile range associated with the median SPI value for each look-back period, according to Table 5;
 - c) Determine the severity level of each look-back period based on the percentile ranges in Table 5.

A summary table with all look-back periods and their corresponding severity levels is presented to the DMTF. The full set of look-back periods will provide a sense of the change in conditions over time. Based on discussion, the DMTF will then select the most relevant look-back period(s) and determine the overall severity level for the index. For example,

- i) During normal conditions, a shorter look-back period may be selected to highlight the potential onset of a drought due to recent, short-term deficits.
- ii) During a long-term drought, a longer look-back period may be selected because a short recent period of average precipitation may not be sufficient to end drought conditions and the previous deficits are still affecting conditions.

The 1-month look-back period is intended to provide information about current conditions but it is not intended to drive the severity level of the index because one isolated month of low precipitation does not constitute a drought. Similarly, one month of normal precipitation is not likely to end a drought and recovery in the longer look-back periods would likely be necessary. An analysis of the 36-month look-back period suggested that time periods beyond the 24-month time frame do not provide additional drought signals at the Drought Region scale (see Appendix D). However, based on recent research by Boutt showing a multi-year impact of precipitation in some wells (Weider and

Boutt 2010, Boutt 2016, Boutt 2017) the 36-month look-back period is retained until further research is conducted and experience is acquired.

For purposes of communication with the public, but not for determining drought status, the “percent of normal” precipitation metric will also be calculated and reported, as it is a commonly understood concept by the public. The “percent of normal” value is calculated by averaging monthly precipitation depth across all stations in a region. Then, dividing that value by the average of all other monthly average precipitation depths for that same month of the year over the period of record and multiplying by 100. For example, for the month of April, all April monthly precipitation values in the period of record are averaged, and the current precipitation value is translated into a percent of that average value.

3.4.3 Streamflow

Streamflow can be affected quickly by precipitation deficits and is intended to provide an early signal of environmental impacts, such as impacts to streams, riparian buffer areas, river front areas, wetlands, and other habitats. The Streamflow Index responds faster to deficits in precipitation during the growing season, when a significant amount of the precipitation returns to the atmosphere via evapotranspiration and a smaller proportion makes it to the streams. Streamflow data are acquired from the Massachusetts USGS website at <https://ma.water.usgs.gov/>. A map of the streamgages used in the calculation of this index is provided in Figure 4.

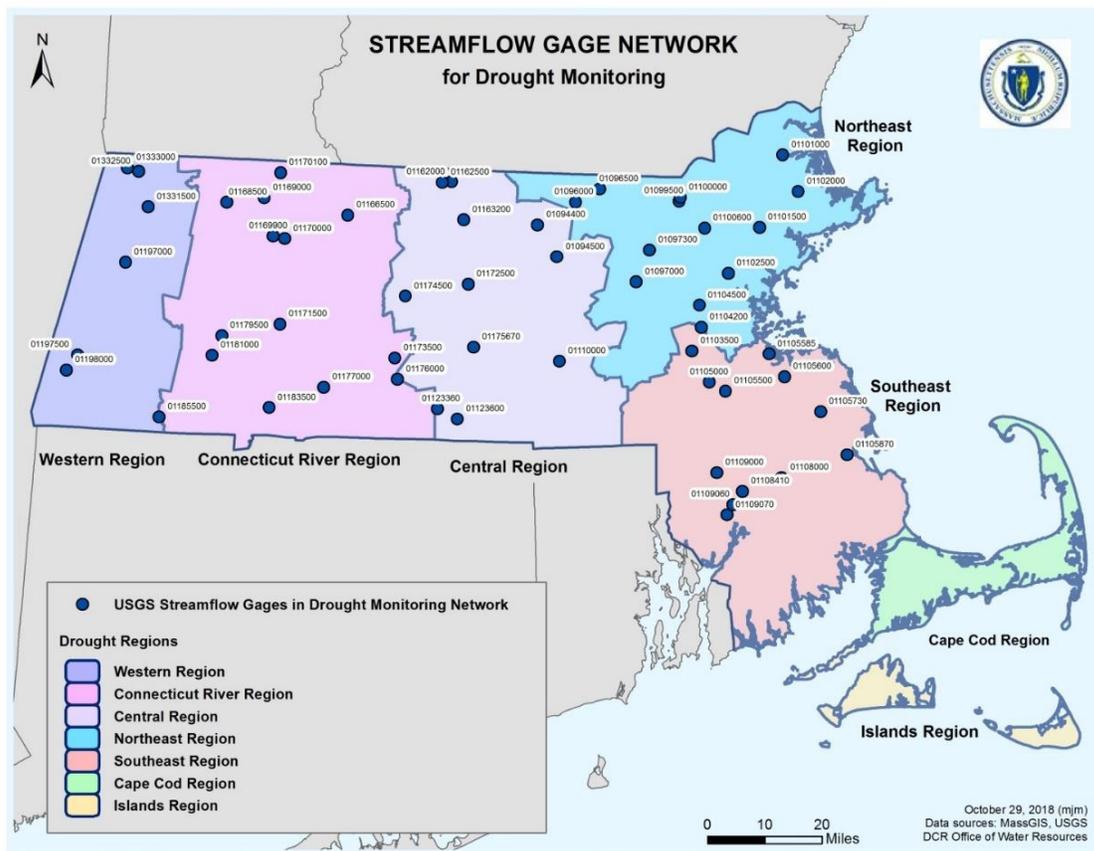

Figure 4: Massachusetts Streamgage Network for Drought Monitoring

The following calculation steps are performed each month:

- 1) For each gage,
 - a) Calculate the median of daily flows for the month; and
 - b) Calculate the percentile of this median flow based on the median flows for the same month of the year over the streamgage’s period of record.
- 2) For each drought region,
 - a) Calculate the median of the individual streamgage percentiles; and
 - b) Determine the severity level based on the percentile ranges in Table 4.

In addition to each region’s proposed severity level, a summary table is presented to the DMTF detailing the number of streamgages in each region at the various severity levels and noting instances of new record low flows. This information may be helpful in any proposed adjustments to the calculated severity level.

3.4.4 Groundwater

The Groundwater Index is intended to show a general overview of the water level in aquifers. Because of recharge lag time and a storage component, this index generally shows drought impacts later than other indices and takes longer to recover. Groundwater data from wells in the USGS Climate Response Network is used for this index and is acquired from the Massachusetts USGS website at <https://ma.water.usgs.gov/>. A map of the wells used in the calculation of this index is provided in Figure 5.

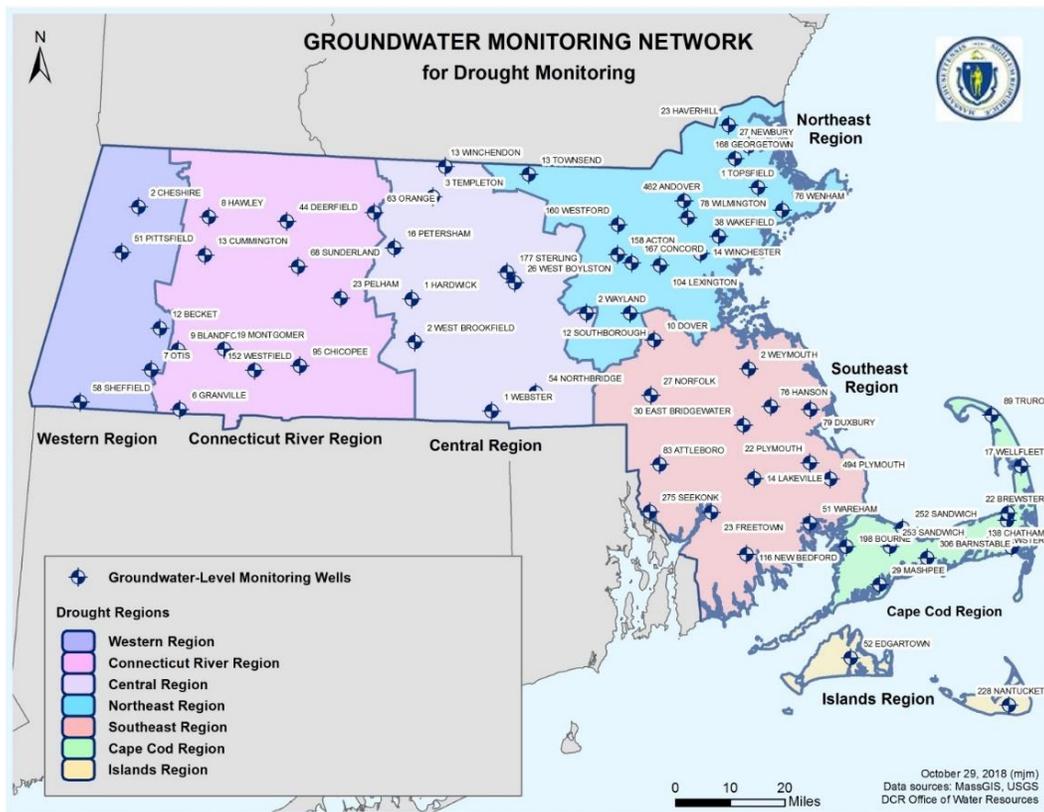

Figure 5: Massachusetts Groundwater Monitoring Network for Drought Monitoring

The following calculation steps are performed each month:

For each well, calculate the percentile of the last available water-level measurement for the month⁷ based on values for the same month of the year over the well's period of record.

- 1) For each drought region,
 - a) Calculate the median of the individual well percentiles; and
 - b) Determine the severity level based on the percentile ranges in Table 4.

In addition to each region's proposed severity level, a summary table is presented to the DMTF detailing the number of wells in each region at the various severity levels, including the number of wells at new record lows. This information may be helpful in any proposed adjustments to the calculated severity level.

3.4.5 Lakes and Impoundments

The Lakes and Impoundments Index characterizes the condition of surface-water storage across lakes, ponds, water supply reservoirs, flood control reservoirs and other human-made impoundments. It is not intended to be a measure of water supply adequacy and, therefore, is not adjusted to reflect drought thresholds in individual public-water system drought management plans. Because of its storage component, this index may show drought impacts later than other indices.

Water-elevation data for this index are acquired from public-water suppliers via personal communication, from online USGS data, and from direct measurements. A map of the lakes and impoundments used in the calculation of this Index is provided in Figure 6.

The following calculation steps are performed each month:

- 1) For each lake or impoundment, calculate the percentile of the last available measurement for the month based on measurements for that same month of the year over the water body's period of record.
- 2) For each drought region,
 - a) Calculate the median of the individual percentiles; and
 - b) Determine the severity level based on the percentile ranges in Table 4.

In addition to each region's proposed severity level, a summary table is presented to the DMTF detailing the number of lakes and impoundments in each region at the various severity levels. This information may be helpful in any proposed adjustments to the calculated severity level. If an outlier in a location's data is noticed, the responsible entity for that location will be contacted to determine whether the location should be included in that month's assessment. For example, a reservoir may artificially draw down water levels to allow for maintenance. In this case, the measurement is not comparable to measurements in the period of record and would be excluded.

⁷ Wells are either measured periodically (manually, once per month, and generally the last week of the month) or continually (real-time equipment measure data at 15-min or hourly intervals)..

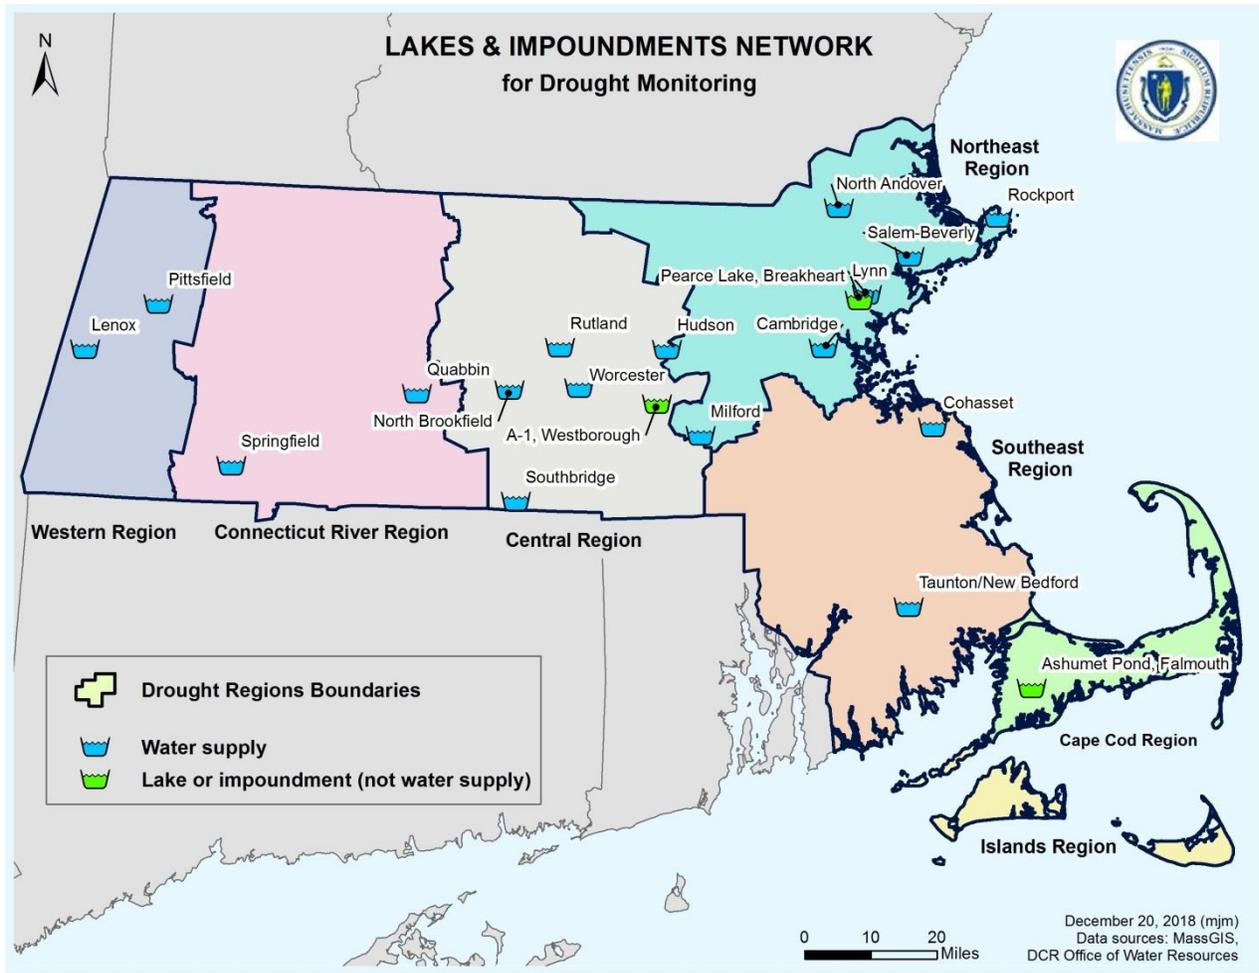

Figure 6: Massachusetts Lake and Impoundment Monitoring Network for Drought Monitoring

3.4.6 Fire Danger

The values used for the Fire Danger Index are those from the Keetch-Byram Drought Index (KBDI). KBDI is a drought index for fire potential assessment and relates to the flammability of organic material in the ground. It attempts to measure the amount of precipitation necessary to return the top eight inches of soil to full “field capacity”, that is, the total moisture the soil can retain once excess has drained. Each of the 14 Fire Districts of the Massachusetts Bureau of Forest Fire Control and Forestry calculate and report KBDI values, usually March 1 through November 30. During the cooler, wetter months of December through February, KBDI is not calculated because fire danger is low. However, the Fire Chief, as member of the DMTF, provides updates should any fire danger arise.

At least one Massachusetts Fire District is in each of the seven Drought Regions. A map of the Fire Districts overlaid with the Drought Regions is provided in Figure 7.

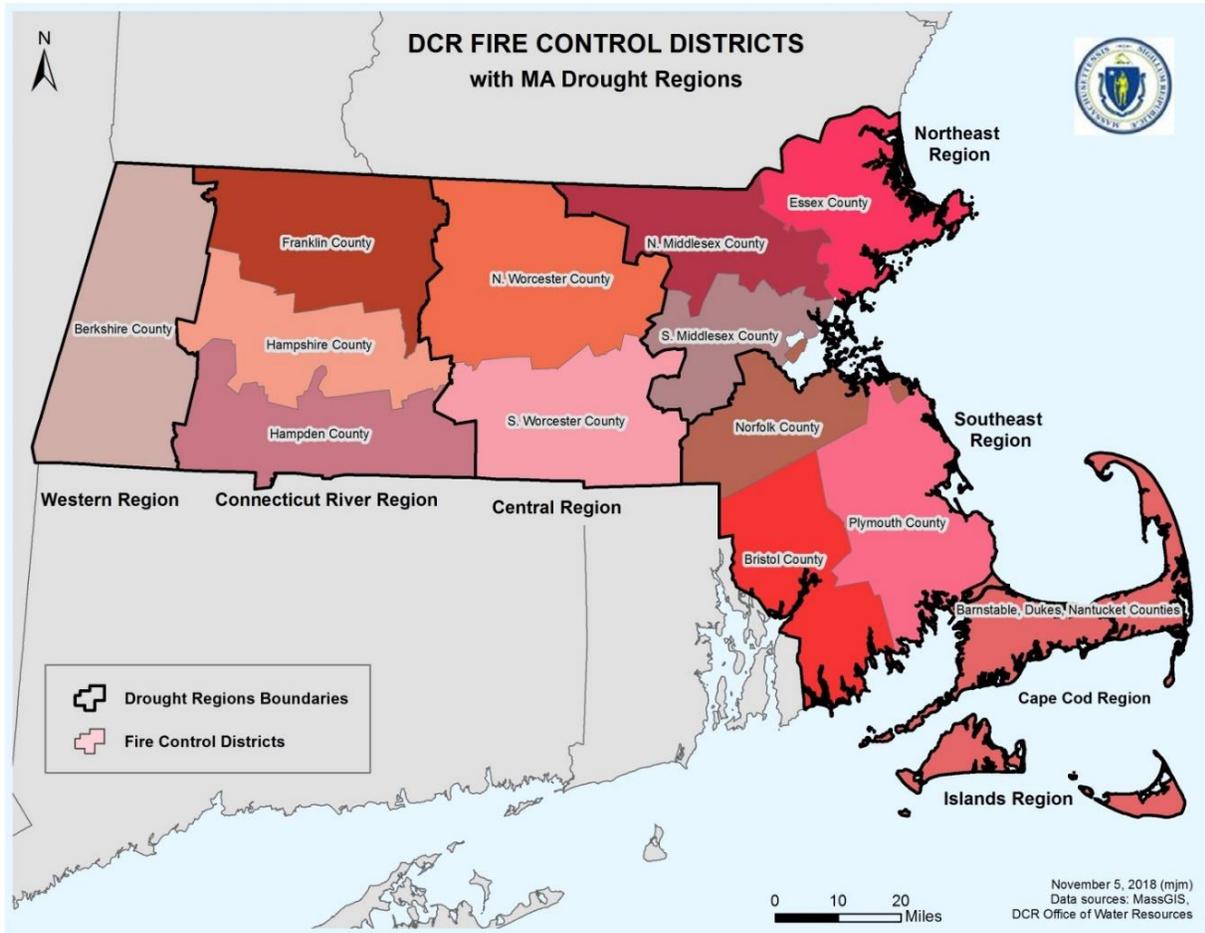

Figure 7: Fire Control Districts for Drought Monitoring

The approach for this index differs from other indices because historical data for KBDI is not available; therefore, calculating the percentile value of a KBDI for its period of record is not feasible. Instead, the Fire Danger Index is determined using the following steps:

- 1) For each district, the latest available weekly KBDI value is used.
- 2) For each region,
 - a) If there is more than one fire district, select the higher value (i.e., higher fire danger); and
 - b) Translate KBDI values to index severity levels using Table 6.

Table 6. Fire Danger Index - Severity Levels and Corresponding KBDI Values

Index Severity Level	KBDI Range
0	<200
1	200 to <400
2	400 to <600
3	600 to <700
4	700 to <800

3.4.7 Evapotranspiration

The Evapotranspiration Index is intended to capture the effect of high temperatures on evaporation and transpiration, which can result in less precipitation remaining in the environment than during cooler seasons. This index can provide an early warning of drought onset during the warm growing season. It can also provide a sense of the stress on the agricultural industry both as potential impacts on non-irrigated agriculture and higher water costs for irrigated agriculture.

The Crop Moisture Index (CMI) has been used in the DMP since 2001. It estimates the deficit between precipitation retained in soil and the potential evapotranspiration needs of crops. NOAA produces a national map of CMI values on a weekly basis⁸. Massachusetts is divided into three districts and CMI values are provided for each. Figure 8 shows a map of these districts.

⁸ http://www.cpc.noaa.gov/products/analysis_monitoring/regional_monitoring/cmi.gif

Table 7 below shows the severity levels corresponding to CMI values. CMI values can change significantly from week to week because it is a rapidly responding index. The latest available weekly value is reported.

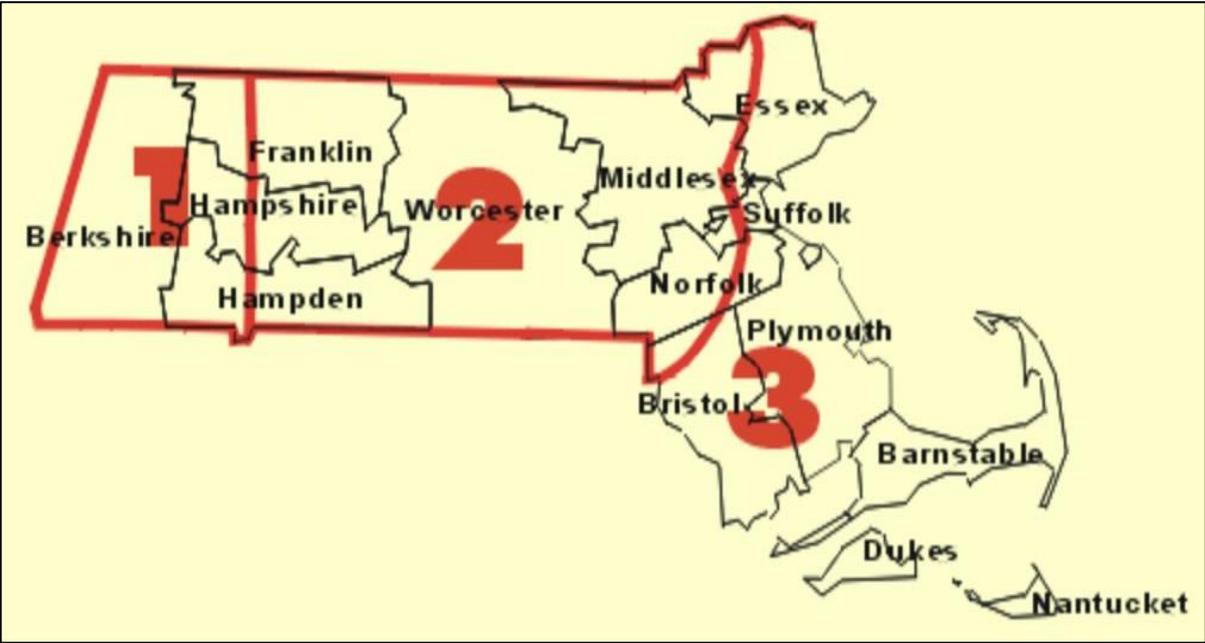

Figure 8: Crop Moisture Index regions

Table 7. Evapotranspiration Index and Corresponding CMI values

Index Severity Level	Crop Moisture Index
0	> -1.0
1	≤-1.0 and > -2.0
2	≤-2.0 and > -3.0
3	≤ -3.0 and > -4.0
4	≤-4.0

Some limitations to this Index have been identified. First, the national maps use only three data points for Massachusetts. Also, the CMI was developed and calibrated for the grain-producing regions of the central United States^{9,10} and may not be accurate for Massachusetts at the regional scale for all drought regions. Until further research and testing is completed on alternatives, the CMI will be retained as the Evapotranspiration Index.

3.4.8 Additional Information

In addition to the drought indices, other relevant information is presented to the DMTF by various task force members as described below. The DMTF relies upon this additional information for a comprehensive characterization of drought conditions and impacts and weighs it in their discussions and drought determinations.

3.4.8.1 Forecasts

The NWS presents the following information and forecasts:

- Recent weather and any large-scale climatic events that may be contributing to local weather patterns (e.g., El Niño) in recent or coming months;
- Snowpack status including water equivalent of snowpack relative to historical data, and rain-on-snow or snowmelt events;
- Weather forecasts for the 7-day, 2-week, 1-month and 3-month timeframes¹¹;
- One- and three-month outlooks on potential drought conditions¹²; and
- Streamflow forecasts.

These data may help interpret anomalies in the drought indices and provide forecasts that can be helpful when determining drought severity for a region.

¹⁰ <http://www.droughtmanagement.info/crop-moisture-index-cmi/>

¹¹ <http://www.cpc.noaa.gov/products/forecasts/>

¹² <http://www.cpc.ncep.noaa.gov/products/Drought/>

3.4.8.2 Impact Reports

Multiple agencies and organizations provide information and qualitative summaries of drought impacts on various interests, including public drinking water supplies, public health, public utilities, agriculture, aquatic ecosystems, forests, and recreation. Table 3 all other values for that month at that site over the period of record. A percentile is a value on a scale of 0-100 that indicates the percent of a dataset that is equal to or below the value. For example, a monthly average streamflow value at the 30th percentile is equal to or greater than 30 percent of the monthly average streamflow values for that site for that month during all the years in the period of record. Characterizing how unusual a given condition is at a given site in this manner follows methods of the USGS and the U.S. Drought Monitor and allows for useful comparisons among sites with different hydrologic characteristics. For a site to be included in the analysis, the site must have a period of record of at least ten years.

Conditions are then characterized at a regional scale by the median of all the individual sites' percentiles within that region. This median percentile is categorized as one of five index severity levels, based on the ranges shown in Table 4. The severity level for any index may be different from the overall regional drought level, which is a comprehensive assessment of all 6 indices. For example, if the median percentile value across the details each agency and organization and its reporting responsibilities. Information gathered through other sources such as the Drought Impact Reporter¹³ may also be considered.

Section 4: Process of Determining Drought Status

This section describes the process by which state entities determine drought status. The process has three components: the DMTF reviews data and makes a determination; the DMTF makes formal recommendations to the EEA Secretary; and the EEA Secretary declares drought levels for each region.

4.1 DMTF Deliberation and Drought Recommendation

As described in Section 3 above, DCR Office of Water Resources staff routinely collect and analyze data and report on hydrologic conditions on a monthly basis to the Water Resources Commission. When the analyses indicate that conditions are drying and action may be warranted by the Drought Management Task Force, EEA and MEMA convene a DMTF meeting.

DMTF members present the data and information described in Sections 3.3 and 3.4. An opportunity is also provided for members of the public to contribute additional information. The DMTF reviews and discusses the presented information and deliberates on a drought level for each region.

The DMTF may consider whether a region(s) is coming into a drought, is experiencing ongoing drought, or appears to be emerging from a drought. In each phase, different indices and information may be weighted more than others. For example, the faster-responding indices such as the Precipitation (short-term look-back periods), Streamflow, Evapotranspiration, and Fire Danger indices

¹³ <http://droughtreporter.unl.edu/submitreport/>

may be the first to signal a developing drought. During drought recovery, the Groundwater and Precipitation (long-term look-back periods) indices will likely weigh more heavily, as these can take longer to recover from drought deficits. Additionally, forecast data and the forecasted status of the indicators will be considered. The meetings conclude once the DMTF has evaluated all available and relevant information and determined a drought-level recommendation for all regions. The DMTF provides these recommendations to the Secretary of EEA. The DMTF continues to meet at least monthly for the duration of the drought.

4.2 Drought Declaration

After due consideration of the information and recommendations provided by the DMTF – including current conditions, on-the-ground impacts, relative severity of indices, and forecasts of climatological and hydrological conditions – the Secretary of EEA declares the drought levels for each region across the Commonwealth.

4.3 End of Drought

Determinations regarding the end of a drought focus on the precipitation and groundwater indices. Precipitation is a key factor because it is the overall cause of improving conditions. Depending on the severity and length of the drought, surplus precipitation is likely necessary not only for recovery of the shorter but also for the longer look-back periods. In determining the end of drought, the DMTF may discount short-term precipitation surplus and focus on longer term precipitation recovery. Additionally, the DMTF will consider the timing of precipitation events, because the same amount of precipitation can differ in its effect on drought conditions depending on the season. Precipitation occurring during the fall and spring, when the ground is not frozen and evapotranspiration is relatively low, is ideal for groundwater recharge and, therefore, will result in the quickest return to normal groundwater conditions. Groundwater levels are also good recovery indicators because they have a storage component that may require time to recharge to average levels making them, in general, among the last of the indices to respond to improving conditions.

Section 5: Drought Communication

Establishing clear lines of communication with the public, public safety partners, and decision-makers to ensure they have accurate and timely information on which to base decisions is a key component to managing and responding to droughts. Clarity and consistency of message is also critical. EEA and MEMA will serve as the primary coordinating entities for drought communications. This section of the plan outlines the general notification and communication framework for drought management.

5.1 Communication Platforms

Primary communication among EEA, MEMA, and state agencies and departments with roles and responsibilities under this plan is via telephone and e-mail. As required, and at the direction of EEA, conference calls and in-person meetings may be utilized. If the event warrants (e.g., emergency

drought), MEMA's WebEOC¹⁴ should be utilized to record, share information, and guide support activities.

Additionally, EEA will manage and regularly update a drought-specific website, and provide the following information:

- Drought maps and any current drought declarations
- Links to relevant data
- Frequently asked questions about the drought
- Information about community water restrictions
- Access to messaging and other outreach material
- Information for private well owners
- Tips on saving water for various sectors
- Information on disaster assistance for drought-affected sectors
- Links to agency drought-related pages
- Case studies of drought response and water conservation successes

The following direct forms of communication will also be utilized, as appropriate:

- Conference calls with municipal officials with the assistance of MEMA
- Regular mailings (e.g., DEP mailings to the water supply community after DMTF meetings with updates about drought status, tips, and information on recommended practices)
- Email distribution lists managed by various state agencies
- Use of local reverse 911-type systems to deliver messages
- Stage agency social media platforms
- High-visibility public signage, such as on major highways
- Printed material posted or distributed at state properties
- Massachusetts Alerts app (via MEMA) for very severe conditions

5.2 Communication with State and Local Entities

During a drought, EEA and MEMA will jointly communicate with local and state entities on hydrological conditions, drought-level transitions, potential impacts, and appropriate response actions or measures.

5.2.1 EEA and MEMA Responsibilities

Once EEA has determined that any region of the Commonwealth has entered a drought or a new drought level, the following notification steps will be taken:

- EEA will notify state agencies and partners of a drought level transition;
- MEMA will develop a Situational Awareness Statement (SAS) regarding the drought level and hydrological conditions and will coordinate with EEA to disseminate the SAS to local and state stakeholders;

¹⁴ WebEOC is a web-based crisis management system.

- EEA will update its drought webpage with a drought status report;
- EEA will communicate drought-related guidance and recommendations from the DMTF to state agencies and departments; and
- EEA will provide updates to the appropriate state agencies and departments, as needed.

5.2.2 Other State Agencies' Responsibilities

To ensure that all local stakeholders are notified about drought conditions, specific state agencies will be responsible for communicating with their constituents. Table 8 lists the state agencies and departments responsible for notifying specific local entities. The method of notification will be determined by the responsible agency; however, redundant means of communication are strongly encouraged.

Table 8. Notification List for State Agencies

Entity Receiving Notification	Agency Providing Notification
Public Water Suppliers	Department of Environmental Protection Department of Public Utilities
MWRA Community Water Suppliers	Massachusetts Water Resources Authority
Local Boards of Health	Department of Public Health Department of Environmental Protection
Foresters	Department of Conservation and Recreation
Farmers	Department Agricultural Resources
Other Large Water Users (including industrial consumers and golf courses)	Department of Environmental Protection
Local Fire Departments	Department of Fire Services DCR Bureau of Forest Fire Control and Forestry

5.3 Communicating with the Public

It is extremely important that accurate and timely information about the current status of drought conditions and the resultant impacts are communicated to the public. Consistent messaging is the key to effective communication with the public. EEA’s press office will be the primary vehicle through which information will be made available to the general public. EEA will partner with other agencies or offices (such as MEMA, Department of Public Health) when jointly released public announcements are needed to bring attention to the situation or to communicate specific response actions.

As needed, EEA will hold a press conference to alert the general public to information about a drought. Additionally, information may be shared through various print and social media outlets and direct communication avenues, including, but not limited to, the following:

- Regular press releases
- Water conservation-related Tweets
- Social media outreach on platforms of all involved state agencies
- Signs on the highways, private digital billboards (through MassDOT’s PSA program), and MassDOT variable messages signs (VMS)
- Flyers and factsheets to hand out at state properties
- Massachusetts Alerts app (via MEMA) for more severe conditions

For impacted businesses, including those in the agricultural sector, EEA will coordinate with state agencies to provide and publicize helpful web-based resources.

Receiving communications from the public is also of critical importance during a drought, to help monitor the extent of impacts. To this end, EEA will use the above communication strategies to build

public awareness of the national web-based platform, the Drought Impact Reporter¹⁵. EEA will encourage its use by the public to document drought impacts, including but not limited to impacts to private wells, fisheries and wildlife, streams and aquatic habitats, crops and agricultural operations, industry, tourism, and recreation.

5.4 Emergency Alert and Notification

If an emergency condition exists requiring state response, MEMA may activate the State Emergency Operations Center (SEOC) and will utilize several systems and tools, as outlined in the Commonwealth's Comprehensive Emergency Management Plan (CEMP), to notify emergency response partners. These partners come from a myriad of local, state, federal, nonprofit and private-sector organizations. MEMA will also utilize WebEOC as a primary information sharing and situational awareness tool during response and recovery activities.

Public warnings may be issued when there is a threat to life, property, and safety. When the need to relay a public warning is present, MEMA will coordinate with EEA and all other appropriate stakeholders (e.g., Department of Public Health, Department of Fire Services, DCR Bureau of Forest Fire Control and Forestry) to develop public warning messages. MEMA's Communications Center, serving as the state's Primary Warning Point, will disseminate these messages via established public warning systems. MEMA may also disseminate public warnings and messages via smartphone applications, the mass.gov and MEMA websites, and established social media platforms.

5.5 Notification of the End of Drought Conditions

Once a drought is determined to have ended, as described in Section 4.4, EEA and MEMA will engage in public outreach. Additionally, relevant agencies and organizations should communicate this information to their target audiences. This message should not only include an update on the current conditions, but should communicate the need for general conservation measures and emergency planning as part of good water resource management practice.

Section 6: Summary of Responsibilities by State Agency

This section describes in further detail the responsibilities of each state agency on the DMTF. Table 1 in Section 2.4 also summarizes the responsibilities of state and federal agencies.

6.1 Executive Office of Energy and Environmental Affairs (EEA)

As a state cabinet-level office, the Executive Office of Energy and Environmental Affairs oversees both environmental and energy agencies, including the Departments of Conservation and Recreation, Energy Resources, Environmental Protection, Agricultural Resources, Fish and Game, and Public Utilities. EEA serves as co-chair, along with the Massachusetts Emergency Management Agency, of

¹⁵ <http://droughtreporter.unl.edu/submitreport/>

the Drought Management Task Force, convening DMTF members and considering their technical input in making a decision about the geographical extent and severity of drought conditions.

In general, EEA manages all coordination with the media and is the lead state agency responsible for communicating and coordinating with other state agency stakeholders and partners regarding drought response actions and activities at the state level, and for coordinating with the Governor's office as well as the federal government on technical and financial assistance. In preparation for and during a drought, EEA directs, in coordination with EEA agencies, the development of drought and water management policies; develops the public communications strategy; and generally coordinates and directs the actions of the agencies it oversees.

6.2 Massachusetts Emergency Management Agency (MEMA)

The Massachusetts Emergency Management Agency (MEMA) serves as the state agency with primary responsibility for ensuring the Commonwealth's resilience to disasters. MEMA is responsible for coordinating and implementing the statewide emergency management program. The program is supported by local, state, federal, nongovernmental and private-sector organizations that have capabilities to prevent, mitigate, prepare for, respond to, and recover from emergencies impacting the Commonwealth.

During a drought, MEMA serves as Co-Chair of the Drought Management Task Force coordinating with the EEA to convene DMTF members and facilitate meetings. MEMA also serves in a supportive and coordinating role in drought planning, preparedness, response and recovery activities as needed. This includes providing planning guidance and support, logistics and resource support, situational awareness management and dissemination, event tracking and documentation, and notification and communications coordination. In addition, MEMA provides support to local authorities as required to address community-specific requirements. These roles are defined further in the Comprehensive Emergency Management Plan.

6.3 Department of Conservation and Recreation (DCR)

DCR's **Office of Water Resources (OWR)** manages the state's Rainfall Program, a network of 140 precipitation observation stations, and a precipitation database for research and analysis. DCR uses its precipitation data to calculate a composite of precipitation conditions statewide and in each of the seven drought regions. Staff at OWR also serve as staff to the Massachusetts Water Resources Commission (WRC) and the DMTF. The office prepares a monthly report on Hydrologic Conditions in Massachusetts for the WRC and for the DMTF when it meets. The report summarizes monthly precipitation amounts and trends, streamflow conditions, groundwater and reservoir levels, drought conditions and forecasts from federal agencies, fire danger, and soil moisture via evapotranspiration.

DCR's Office of Water Resources also plays a key internal coordination role, assisting in DMTF meeting preparation and summaries and acting as a liaison between the DMTF co-chairs and the agencies responsible for data collection and analyses. Staff from the Office of Water Resources were also key authors of this plan.

Assessment of fire risk and management of fire control resources is an ongoing activity of DCR's **Bureau of Forest Fire Control and Forestry**. Risk of fires in wild land, rural areas, and state forests and parks are linked to dry conditions, and a drought can affect the availability of water for fire suppression. The Director of Forestry manages state fire suppression resources and coordinates with local, state, and federal agencies and other states on the appropriate resources, as needed. Both before and during a drought, the Bureau of Forest Fire Control and Forestry monitors and reports on the level of fire danger in each drought region.

The DCR **Offices of Engineering and Dam Safety** manage key infrastructure across the state including the operations and maintenance of many flood control structures. As part of their role on the DMTF, the offices will assess conditions and report on the Charles and Mystic rivers flood control dams, as well as report on other critical DCR infrastructure.

6.4 Department of Environmental Protection (MassDEP)

MassDEP oversees various aspects of water supply, allocation and resource protection through its Water Management Act, Drinking Water, and Wetlands programs. The agency also has the authority to declare water emergencies for communities with water supply systems that are experiencing public health or safety threats, including drought conditions and contamination.

MassDEP's **Water Management Act Program** tracks the implementation of water use restrictions by municipalities across the state and regularly prepares maps showing the status of restrictions. MassDEP Boston staff consults with regional Drinking Water Program staff to identify potential problem areas or identify specific Public Water System (PWS) issues. During periods of low streamflow, MassDEP corresponds with permit holders and all PWSs to encourage them to review their permit requirements, encourage additional conservation measures, and suggest that more stringent water-use restrictions be implemented. MassDEP's authority to declare local emergencies is outlined in detail in Section 10.2.1 of this plan.

MassDEP's **Wetlands Program** regulates activities in wetlands and river front areas and assesses their conditions and impacts. They provide outreach to local officials to help them protect wetlands in their towns.

6.5 Department of Agricultural Resources (DAR)

Crop losses can pose severe financial constraints on farmers, aquaculturists, and other agricultural businesses. During drought conditions, DAR monitors and reports on the status of crops in each drought region.

In general, the Department encourages farmers to take advantage of agricultural grant opportunities and financial assistance programs offered by DAR, such as funding programs that help to reduce the impacts of climate change on agriculture and to enhance the economic resiliency of agricultural operations.

DAR works with the USDA and UMASS Extension, along with the Executive Office of Energy and Environmental Affairs and other state agencies, to collect information and monitor drought conditions and to identify any needed resources on behalf of the agricultural community. Regular communications to farmers and the agricultural community are provided through the Department's email listserv and the Farm and Market Report to highlight any resources that may be available from state and federal agencies. These efforts are combined with encouraging the public to purchase local agricultural products even during drought conditions to help support local farms.

During a drought, DAR is responsible for working with the United States Department of Agriculture's (USDA) Massachusetts Farm Service Agency (FSA) to communicate information from farmers and the agricultural community about agricultural products and livestock that are actually or predicted to be impacted by drought.

DAR works with UMASS Extension to distribute a crop loss survey to farmers so they can report directly on crop losses resulting from drought. As a result of reported crop losses, federal assistance may become available through the FSA. The USDA designates counties as primary natural disaster areas based on crop losses caused by drought. A USDA declaration makes farms in designated counties eligible for assistance from FSA, including low-interest emergency loans. In addition, FSA has a variety of assistance programs that are triggered based on the US Drought Monitor and that do not require a disaster declaration.

6.6 Department of Fish and Game (DFG)

The impacts of dry conditions on fisheries and wildlife range from reduced habitat to fish kills, displacement of certain populations of animals, and increased human-wildlife interactions that include mortality or injury, population losses, and inability to find sufficient refugia. Drought can affect both individual organisms and populations.

The **Division of Fisheries and Wildlife (DFW)** at DFG serves as first responder to fish kills through a formal interagency Memorandum of Understanding between DFW, MassDEP, DAR, and the Office of Law Enforcement. Other responses to drought include identifying impacts to specific fisheries and wildlife populations as they are developing so that DFG and other agencies, such as local governments or MassDEP, can implement measures to reduce the impacts to these resources. In some cases, population impacts may require regulatory changes to hunting seasons, permits, bag limits, species listing, or site-specific habitat management actions, or the regulatory review of projects that might impact the habitat of state-listed rare species.

DFG's **Division of Ecological Restoration (DER)** monitors streamflow at sites across MA to better understand streamflow alteration and document and implement streamflow restoration projects. The majority of sites are located on headwater streams with watersheds smaller than 15 square miles. During dry periods and droughts, DER increases the frequency of data collection, coordinates

with project partners on updates on local streamflow conditions and impacts, and provides updates and photos at DMTF meetings. DER also coordinates with partners to adjust streamflow releases based on existing drought management/streamflow release plans.

6.7 Department of Public Health (DPH)

Dry conditions can affect the availability and the quality of water. DPH provides oversight or assistance to local boards of health (BOHs) by transmitting drought-related information and responding to drought-related issues, such as impacts on private wells and recreational water quality impacts. DPH beach regulations require regular water quality monitoring for fecal indicator bacteria (FIB) and public notification of unsafe conditions. On occasion, freshwater waterbodies (with or without beaches) are monitored for harmful algae. When beaches and waterbodies exceed FIB standards or algae guidelines, they are posted with a notice alerting the public to possible risk. BOHs and the MA Department of Conservation and Recreation (DCR) are required to report the water quality monitoring data to DPH on an annual basis. The Department can also communicate with local BOHs during a drought on impacts to private well users and disseminate information and resources to affected communities and/or users.

6.8 Department of Public Utilities (DPU)

The DPU oversees investor-owned water utilities, or every person, partnership, association or corporation, other than a municipal corporation, and other than a landlord supplying a tenant, engaged in the distribution and sale of water in the Commonwealth through its pipes or mains. This excludes municipally owned water systems, water and fire districts, and homeowner associations that provide water service. DPU oversees water companies seeking to alleviate the effects of a long-term drought or frequently occurring droughts by purchasing or taking by eminent domain waters or lands for collecting, storing, holding, purifying, and preserving water within its franchise territory. Also, DPU is able to grant a water company the authority to acquire and hold real estate beyond amounts limited by the company's charter or special laws if DPU finds that such additional real estate is necessary or convenient for the company to carry out the purposes of its organization and the acquisition and holding will not be contrary to the public interest.

Section 7: Drought Preparedness and Response Actions of State Agencies

This section describes the roles and responsibilities of state agencies in preparing for a drought and responding to drought conditions at various levels of intensity.

7.1 State Agency Drought Preparedness Actions

Actions taken before a drought begins ensure that state agencies are positioned to respond effectively when drought conditions emerge. Some actions taken in preparation for a drought, such as development of policies or the implementation of water conservation measures, can help to delay or minimize the impacts of drought. Preparedness actions by state agencies include routine data gathering and analysis; establishing lines of communication among local, state, and federal agencies;

developing a public communications and outreach plan; developing policies that will help lessen the effects of drought; and providing technical and financial assistance in implementing sound water conservation and management practices. Table 9 outlines key drought preparedness actions of state agencies.

Table 9: State Preparedness Actions

Action Category	Actions	Responsible Agency
Data Gathering, Analysis, and Reporting	<ul style="list-style-type: none"> • Collect data for calculating six drought indices. • Analyze hydrologic conditions and produce monthly report disseminated through the Water Resources Commission. • Assess monitoring networks for data gaps and data quality. Address identified data needs. • Pursue opportunities, as feasible, to automate field data collection to support more timely and more frequent assessment of hydrologic conditions. 	DCR
	<ul style="list-style-type: none"> • Identify drinking water supply sources and interconnections that can be activated in an emergency and periodically update listings. Such sources may include regional and bulk water suppliers, well drillers, mobile treatment units, and interconnections. Update information at least yearly. • Monitor the statewide progress of communities in meeting the residential consumption (65 gpcd) and unaccounted-for water (10%) performance standards through review of Annual Statistical Reports. Work with communities to achieve compliance. 	MassDEP
Coordination	<ul style="list-style-type: none"> • Convene meeting of the Drought Management Task Force at least annually, or more often if needed, to assess drought preparedness. Establish lines of communication among members of the Drought Management Task Force and update contact information for effective coordination when a drought is in effect. 	EEA, MEMA
Water Conservation	<ul style="list-style-type: none"> • Implement the standards and recommendations of the <i>Massachusetts Water Conservation Standards</i> at state facilities. • Widely publicize the Massachusetts drought management nonessential outdoor water-use restrictions. • 	All agencies
Communication and Public Outreach	<ul style="list-style-type: none"> • Develop a communications strategy to inform the public and communities about drought conditions, raise public awareness about the importance of using water wisely, and actions for reducing water use. It may include the following: <ul style="list-style-type: none"> ○ Create websites for public outreach and drought impact reporting, including: 1) Up-to-date drought information and links; 2) water conservation tips and resources; and 3) a portal for reporting drought impacts. 	EEA, MEMA, DCR, MassDEP, DPH

Action Category	Actions	Responsible Agency
	<ul style="list-style-type: none"> ○ Establish lines of communication with traditional media outlets, including newspapers, television, and radio outlets. ○ Develop templates and a schedule for using a variety of social media platforms to communicate with the public about drought. ○ Develop educational leaflet for private well owners on drought response with actions such as checking well water levels, and conserving water. 	
	<ul style="list-style-type: none"> ● Develop a wildland fire prevention education program. 	DCR
	<ul style="list-style-type: none"> ● Disseminate the Massachusetts Water Conservation Standards to all public water suppliers and communities. 	EEA, DCR, MassDEP

	<ul style="list-style-type: none"> • Develop recommendations for legislation to implement statewide outdoor water-use controls. 	EEA
	<ul style="list-style-type: none"> • Evaluate barriers to and opportunities for reuse of graywater and reclaimed water. Review regulations and update, if needed. 	EEA, MassDEP

7.2 State Agency Drought Response Actions

When drought conditions begin to emerge, the Executive Office of Energy and Environmental Affairs convenes the Drought Management Task Force. State agencies continue many of the actions taken to prepare for a drought at a more intense level or on a more frequent basis. Data gathering, analysis, and reporting continue, with an emphasis on determining the extent and severity of drought conditions in each drought region. State agencies also intensify their coordination, communication, and technical and financial assistance actions in response to each drought level. This section outlines key response actions of state agencies in response to each level of overall drought.

The actions in Table 10 below apply to all outdoor water users and represent one of the most effective ways to minimize the impacts of drought on water supply and the environment.

Table 10: State Drought Guidance

State Drought Condition (by Region)	Nonessential Outdoor Water Use Restrictions
Level 1 (Mild Drought)	1 day per week watering, after 5 p.m. or before 9 a.m. (to minimize evaporative losses)
Level 2 (Significant Drought)	Limit outdoor watering to hand-held hoses or watering cans, to be used only after 5 p.m. or before 9 a.m.
Level 3 (Critical Drought)	Ban on all nonessential outdoor water use
Level 4 (Emergency Drought)	Ban on all nonessential outdoor water use

7.2.1 Level 1- Mild Drought

At Drought Level 1, the emphasis is on conservation through education, communication and planning. The overall objective is to take action under the precautionary assumption that conditions may deteriorate further. Key response actions that should be undertaken are captured in Table 11a.

Table 11a: State Agency Drought Response Actions during a Level 1 Mild Drought

<u>Action Category</u>	Response Actions	Responsible Agency
LEVEL 1, MILD DROUGHT		
Data gathering, analysis, and reporting	<ul style="list-style-type: none"> Review data and calculate six drought indices; report on the severity of conditions for each index. Prepare and distribute monthly summary of hydrologic conditions (Current Water Conditions in Massachusetts) to Water Resources Commission and DMTF. Monitor Drought Portal for public reporting of drought impacts (e.g., to agriculture, private water supplies, fisheries, wildlife, and the environment). 	DCR
	<ul style="list-style-type: none"> Gather information and report on the status of drinking water supplies. 	MassDEP
	<ul style="list-style-type: none"> Gather information and report on impacts to agriculture. 	DAR
	<ul style="list-style-type: none"> Gather information and report on impacts to fisheries and wildlife. 	DFG
Coordination	<ul style="list-style-type: none"> Convene monthly meetings of DMTF. Members report on affected resources and user groups. 	EEA, MEMA
	<ul style="list-style-type: none"> Assess conditions to determine drought level in each drought region. Recommend regional drought-level declarations to EEA Secretary. 	DMTF

Action Category	Response Actions	Responsible Agency
Water Conservation	<ul style="list-style-type: none"> • Continue to implement the standards and recommendations of the <i>Massachusetts Water Conservation Standards</i> at state facilities. • Implement the Massachusetts drought management nonessential outdoor water-use restrictions. • Advise local governments to introduce outdoor watering restrictions, if not already in place. 	All agencies
Communication and Public Outreach	<ul style="list-style-type: none"> • Prepare memorandum on status of situation for Governor’s Office, EEA Secretary, Secretary of Public Safety and Security, and other agencies, as needed. • Implement communications strategy to inform the public about drought conditions, raise awareness about the importance of using water wisely, and strategies for reducing water use. • In coordination with the Governor’s Press Office, issue state-wide news release and targeted news releases in impacted geographic regions. 	EEA
	<ul style="list-style-type: none"> • Provide updates, as needed, to the state drought status website. 	DCR
	<ul style="list-style-type: none"> • Communicate drought status and recommended actions to stakeholders, including municipalities, water suppliers, agricultural interests, Boards of Health, nonprofit organizations, and wildland fire officials. 	All agencies
Technical Assistance	<ul style="list-style-type: none"> • Host (in coordination with regional planning agencies) regional drought education workshops to guide community drought response efforts. 	EEA
	<ul style="list-style-type: none"> • Continue assistance to communities on implementing the <i>Massachusetts Water Conservation Standards</i> and statewide guidance on nonessential outdoor water-use restrictions (see Table 12). 	MassDEP, DCR
Financial Assistance	<ul style="list-style-type: none"> • Develop recommendations for special legislation and/or state funding to address drought. • Review and confirm options for federal financial assistance for drought. 	MEMA, EEA, DAR
Policy and Regulatory Action	<ul style="list-style-type: none"> • Issue reminders to water suppliers with permits under the Water Management Act to adhere to regulatory conditions in their permits related to drought. 	MassDEP

7.2.2 Level 2- Significant Drought

At Drought Level 2, conditions are becoming significantly dry. Emphasis continues to be on conservation, and more stringent watering restrictions may be imposed by water service providers. Key actions that should be undertaken include the following:

Table 11b: State Agency Drought Response Actions during a Level 2 Significant Drought

Action Category	Response Actions	Responsible Agency
LEVEL 2, SIGNIFICANT DROUGHT		
Data gathering, analysis, and reporting	<ul style="list-style-type: none"> Continue data gathering, analysis, and reporting activities of Level 1. Assess vulnerability of water supplies and environmental resources. 	All agencies
Coordination	<ul style="list-style-type: none"> Continue coordination activities of Level 1. 	All agencies
	<ul style="list-style-type: none"> Host conference call with all municipalities to provide consistent information about the drought and mitigating actions. 	MEMA
	<ul style="list-style-type: none"> Contact local Boards of Health to assess public health threats and impacts to private wells and take actions as needed. 	DPH
	<ul style="list-style-type: none"> Initiate contact and coordination with federal agencies. 	EEA, DAR
Communication and Public Outreach	<ul style="list-style-type: none"> Continue communication and outreach activities of Level 1. 	All agencies
	<ul style="list-style-type: none"> Provide content and issue press releases to advise the public of watering restrictions, encourage conservation, and provide updates on local water supply status specific to the community. 	EEA, DEP
	<ul style="list-style-type: none"> Utilize Mass 2-1-1, mass notification systems, state websites, and MassDOT billboards to advise the public of current conditions and general conservation measures. 	MEMA
Water Conservation	<ul style="list-style-type: none"> Continue water conservation activities of Level 1. Advise local governments to implement next-stage watering restrictions. Provide access to waivers for agricultural producers seeking to meet minimum production levels to maintain farm status for tax purposes, thereby avoiding unnecessary use of water. 	All agencies
Technical Assistance	<ul style="list-style-type: none"> Continue technical assistance activities of Level 1. 	All agencies
	<ul style="list-style-type: none"> Offer technical assistance to communities on managing systems, including use of emergency connections and supplies. Confirm that communities know how to request a declaration of drought emergency. 	MassDEP, MEMA
	<ul style="list-style-type: none"> Offer technical assistance to the agricultural community on water conservation measures. 	DAR
	<ul style="list-style-type: none"> Offer assistance to Boards of Health on addressing private well impacts and obtaining emergency water supplies. 	DPH, MEMA

Policy and Regulatory Action	<ul style="list-style-type: none"> • Continue policy and regulatory activities of Level 1. 	MassDEP

7.2.3 Level 3- Critical Drought

At the Critical Drought Level 3, many sectors, community functions, and environmental resources are facing critical strain. At this stage there is an increased reliance on mandatory conservation measures to augment voluntary measures. Coordination efforts are expanded to include neighboring states, and preparations begin for emergency conditions. Key state actions that should be undertaken include the following:

Table 11c: State Agency Drought Response Actions during a Level 3 Critical Drought

Action Category	Response Actions	Responsible Agency
LEVEL 3, CRITICAL DROUGHT		
Data gathering, analysis, and reporting	<ul style="list-style-type: none"> • Continue data gathering, analysis, and reporting activities of Levels 1 and 2. 	All agencies
	<ul style="list-style-type: none"> • Review information on availability and use of emergency sources of water. 	DMTF
Coordination	<ul style="list-style-type: none"> • Continue coordination activities of Levels 1 and 2. 	All agencies
	<ul style="list-style-type: none"> • Initiate contact and planning with New England states and New York regarding drought coordination and response. 	MEMA, EEA
Communication and Public Outreach	<ul style="list-style-type: none"> • Continue communication and public outreach activities of Levels 1 and 2. 	All agencies
	<ul style="list-style-type: none"> • Prepare Governor’s Proclamation of a State of Emergency. 	MEMA

<u>Action Category</u>	Response Actions	Responsible Agency
Water Conservation	<ul style="list-style-type: none"> • Continue water conservation activities of Levels 1 and 2. • Advise local governments to implement next-stage watering restrictions, including bans on all nonessential outdoor uses¹⁶. • Apply the Massachusetts drought management nonessential outdoor water-use restrictions to all state entities. • Advise all self-supplied users, including private well users, to initiate mandatory nonessential water use restrictions • Advise all public waterworks and self-supplied water users to minimize and/or eliminate nonessential flushing of water lines. 	All agencies
Technical Assistance	• Continue technical assistance activities of Levels 1 and 2.	All agencies
	• Provide assistance to communities seeking alternative or temporary water supplies; prepare for emergency response where risk of loss of supply exists.	DEP, MEMA
Financial Assistance	• Coordinate with federal government agencies to request federal assistance.	MEMA, EEA, DAR
Policy and Regulatory Action	• Continue policy and regulatory activities of Level 1 and 2.	MassDEP

7.2.4 Level 4- Emergency Drought

At the Emergency Drought Level 4, the state may face failure of local or regional drinking water supplies, impairment or loss of supply for firefighting, major agricultural and business losses, and impairment or loss of critical natural resources. In this situation, the objective becomes to implement emergency response actions to protect public health and safety and critical environmental resources, and to minimize losses and damages resulting from drought. Key state actions that should be undertaken in an Emergency Drought are described in the table below. Specific emergency authorities and powers are further described in Section 10.

¹⁶ Essential uses are defined by MassDEP as uses required: a) for health or safety reasons; b) by regulation; c) for the production of food and fiber; d) for the maintenance of livestock; or e) to meet the core functions of a business. Nonessential uses are those *other than* essential uses.

Table 11d: State Agency Drought Response Actions during a Level 4 Emergency Drought

<u>Action Category</u>	Response Actions	Responsible Agency
LEVEL 4, EMERGENCY DROUGHT		
Data gathering, analysis, and reporting	<ul style="list-style-type: none"> Continue data gathering, analysis, and reporting activities of Levels 1, 2, and 3. 	All agencies
	<ul style="list-style-type: none"> Provide a minimum of bi-weekly reports of drought conditions to EEA. Significant changes in drought conditions will be reported weekly. 	DMTF
Coordination	<ul style="list-style-type: none"> Continue coordination activities of Levels 1, 2, and 3. 	All agencies
	<ul style="list-style-type: none"> Update the Governor’s Office on drought conditions on a weekly basis. 	EEA
	<ul style="list-style-type: none"> As needed, confer with state agency partners and local authorities from impacted/threatened communities to determine whether precautionary or protective measures need to be implemented to protect the health and safety of the general public. As warranted, activate Regional Emergency Operations Centers (REOC) and/or the State Emergency Operations Center (SEOC) to coordinate state operations in support of affected communities and mobilize needed resources. As warranted, activate the appropriate Massachusetts Emergency Support Functions (MAESFs) at the SEOC to support and coordinate response missions related to preservation of life, protection of property, and implementation of post- drought actions and activities. As needed, utilize WebEOC to provide continuous situational awareness. As needed, issue emergency notification to local and state agencies and non-governmental organizations. As needed, issue public warnings in accordance with the State’s Emergency Communications and Warning Annex. 	MEMA
	<ul style="list-style-type: none"> Continue communication and public outreach activities of Levels 1, 2, and 3. 	All agencies
Communication and Public Outreach	<ul style="list-style-type: none"> Finalize Governor’s Proclamation of a Drought Emergency to use state emergency authorities and powers to restrict water uses and implement measures to provide emergency water supplies. 	MEMA, MassDEP
	<ul style="list-style-type: none"> Issue weekly press releases targeted to drought emergency areas and encourage local media outlets to publicize updates. 	Governor’s Office
	<ul style="list-style-type: none"> Inform all local Boards of Health within the drought emergency area of the drought emergency status. 	MDPH

Action Category	Response Actions	Responsible Agency
	<ul style="list-style-type: none"> • Inform all public water suppliers within the drought emergency area of the drought emergency status. 	MassDEP
Water Conservation	<ul style="list-style-type: none"> • Continue water conservation activities of Levels 1, 2, and 3. • All agencies and institutions will implement drought water conservation and contingency plans that include mandatory nonessential water use restrictions with the goal of reducing water usage on a graduated basis as conditions worsen, starting with 15% reduction. • All self-supplied users, including private well users, will continue mandatory nonessential water use restrictions • All public waterworks and self-supplied water users eliminate nonessential flushing of water lines. 	All agencies
Technical Assistance	<ul style="list-style-type: none"> • Continue technical assistance activities of Levels 1, 2, and 3. 	All agencies
Financial Assistance	<ul style="list-style-type: none"> • Work to secure state/federal emergency funding and/or legislation. 	EEA, MEMA, DAR, MassDEP
Policy and Regulatory Action	<ul style="list-style-type: none"> • Continue policy and regulatory activities of Levels 1, 2, and 3. 	MassDEP
	<ul style="list-style-type: none"> • For the duration of the declared drought emergency, the Department of Fire Services shall be authorized to declare open burning bans in wildfire-susceptible areas of the Commonwealth. 	DFS, DCR
	<ul style="list-style-type: none"> • For the duration of the declared drought emergency, the Department of Transportation shall be authorized to grant temporary overweight/overwidth/registration/license exemptions to carriers transporting essential emergency relief supplies into and through the Commonwealth in order to support the disaster response and recovery. 	MassDOT

Section 8: Drought Preparedness and Response Actions – Guidance for Communities

8.1 Community Drought Preparedness Actions

Everyone has a role in preparing for and responding to a drought. This section identifies key actions that can be taken at the local level before a drought (to prepare) and during a drought (to respond), along with resources to implement key actions.

The primary audience for this section is municipalities and/or public water systems. A secondary audience includes partners that can support and assist with implementation, including environmental groups, concerned citizens, and local boards such as the planning board, conservation commission, and town select board or city council. At the local and regional level, water suppliers will remain responsible for ensuring that water supplies are adequate to maintain public health and safety. Local governments and water suppliers should monitor their situation closely to ensure that mitigation measures undertaken are sufficient to prevent the loss or failure of water supplies. In the event that loss of supply occurs or is forecast, water suppliers should follow the steps in their Emergency Response and Contingency Plan as required by MassDEP. Depending on circumstances, it may be necessary to impose comprehensive and closely monitored watering restrictions, allocate water on a per capita basis, or seek use of alternative water supplies.

Planning is the key word. One of the most important actions a community can take to prepare for a drought is to develop a local drought plan to guide actions before, during, and after a drought. A critical companion to the local drought plan is a Water Conservation Program, which will help conserve water at all times, but especially during a drought. The Water Conservation Program should be developed before the local drought plan because it will inform the plan. Each of these requires significant effort to develop and establish, but it will be effort very well spent. When the next drought is experienced, appropriate tools and programs will be in place to respond without delay and minimize impacts and disruptions to municipal services, businesses, and residents.

Below is a brief introduction to important components of a Water Conservation Program and a Drought Management Plan, along with resources for additional guidance.

Action 1: Develop a Water Conservation Program

Establishing a year-round Water Conservation Program should be thought of as part of drought management planning. Water conservation is one of the most important tools for both preparing for and responding to a drought. Year-round water conservation, including public education and communication, will help reduce baseline demand. This reduction may lead to greater water supply reserves, creating greater resilience during droughts. A Water Conservation Program also establishes channels of communication with the public, which can be used during a drought.

The Massachusetts Water Conservation Standards (WCS, updated in 2018) provide a broad overview of key water conservation actions for the many types of water users in the state. Highlighted below are four of the most important actions municipalities and water suppliers should include in a Water Conservation Program to support drought preparedness and response.

1. Provide Incentives for Water Efficiency through Effective Water Rates

Developing an effective price signal can be challenging but is worthwhile, because the price of water is an important driver of water conservation behavior. More discretionary uses of water (such as lawn watering and car washing) are the most responsive to price signals. A variety of water rate structures exist that encourage conservation and efficient use year-round as well as additional conservation

during drought. Such rates can be set to provide financial sustainability even with reduced demand. Additionally, a number of billing strategies can encourage conservation. See Chapter 4, Pricing, in the MA Water Conservation Standards for more information on these rates and strategies.

2. Implement an Outdoor Water Use Program

Note: Please work with your local planning board and other appropriate local authorities to review the options and ideas presented here and in Chapter 9 and Appendices B, E, H, I, and J of the MA Water Conservation Standards.

Authority: The first step of an outdoor water use program should be to establish legal authority to limit nonessential outdoor water use. Nonessential outdoor watering is defined as uses not required by regulation, for health or safety reasons, for production of food and fiber, for maintenance of livestock, or to meet the core functions of a business (for example, irrigation by plant nurseries as necessary to maintain stock). Whether through a bylaw, ordinance or other mechanism, establishing authority can take time, so it is important to complete this step prior to the start of a drought. See MassDEP's Model Outdoor Water Use By-Law/Ordinance at <https://www.mass.gov/service-details/model-water-use-restriction-bylawordinance-update>.

Irrigation System Efficiency: The outdoor water use program should address the use and efficiency of irrigation systems. A key factor in improving efficiency is proper design, installation and auditing by professionals holding the appropriate certifications (by nationally recognized certification programs, such as EPA WaterSense-labeled certification programs). In addition, some municipalities have chosen not to allow the installation of new irrigation systems. See MA WCS Chapter 9 and Appendix I for more information.

Land Use Planning: The outdoor water use program should support land use planning and landscaping that minimizes water use. There are bylaws, ordinances, policies or regulations that can encourage or require development and landscaping that minimize site alterations and preserve or restore healthy soils and plant communities appropriate to the Massachusetts climate. Please work with your local planning board and other appropriate local authorities to review the options and ideas presented in Chapter 9 and Appendices B and H of the MA WCS.

3. Implement an Indoor Water Use Program

The scope of an indoor program will be specific to circumstances in each community, but focusing on high-efficiency plumbing products and appliances is likely to achieve significant water and energy savings. Toilets, showers and faucets alone make up 62% of indoor use. The Environmental Protection Agency's WaterSense program labels products and services using rigorous water efficiency, performance, and testing requirements. See Chapter 5 and Appendices A, C, D, and E of the MA WCS for more information on how to encourage greater indoor efficiencies by end users.

4. Implement a Water Loss Control Program

System efficiency is always important, but especially so during a drought. A water loss control program ensures that water entering a distribution system is efficiently delivered to each point of use. Water loss control measures typically fall into two categories: 1) accounting for the water

distributed in the system with accurate and comprehensive metering and record-keeping, and 2) managing the infrastructure to prevent the physical loss of water. Developing a Water Loss Control Program takes time, and system managers must continually evaluate measures of their effectiveness and make adjustments as needed. Therefore, it is important to establish such a program before the onset of a drought. See Chapters 2 and 3 of the MA WCS for more information.

Action 2: Develop a Local Drought Management Plan

A local drought management plan will strengthen a community's ability to provide enough water during a drought. A DMP will outline key actions to be taken in preparation for and during a drought and identify who is responsible for coordinating and implementing the actions. Multiple levels of drought should be defined in the DMP to reflect increasingly severe conditions. Each drought level can then be assigned escalating levels of actions that are appropriate to each drought level. The following summary of planning steps was adapted from the American Water Works Association's 2011 *Drought Preparedness and Response Manual of Water Supply Practices M60*. It gives a snapshot of the process, but those developing a plan should review the full M60 manual and other available guidance referenced in this section for explanations and details.

1. Form a drought response team and establish coordination and communication strategies

This step involves forming a team, and establishing priority objectives and a schedule for completing the plan. The team should outline coordination and communication plans within and between municipal departments, with the community, and among all relevant partner agencies and organizations.

Team Members: M60 notes that every department of the utility will be involved in developing and implementing the plan. In smaller systems this may mean only one or two people do all the work. In medium to large organizations, the team members will probably include multiple departments (such as Administration, Finance, Public Works, Fire, Health and Human Services, Board of Health, Parks and Recreation, Conservation Commission).

Schedule: M60 includes a detailed plan development schedule that can be used to set completion dates for each plan element. It also notes that plan development typically takes three to six months of dedicated effort.

Coordination and Communication: M60 emphasizes that a good plan is contingent upon internal and external coordination and communication and highlights items for the team to consider, such as:

- Establish a community advisory committee.
- If the water supplier is a city or town, include coordination actions with departments such as parks, fire, and the office of emergency services.
- Identify external partners, such as state agencies and local watershed groups, and include coordination and communication with them.
- Establish a public communication program.

2. Forecast Supply in Relation to Demand

The goal of this step is to develop a reasonable estimate of how much water will be available under various shortage conditions, including multi-year droughts. This step involves: supply and demand data collection and analyses, looking ahead to any projected changes in supply or demand, and conducting analyses to help identify and quantify potential supply shortfalls under various scenarios of drought and supply interruptions. M60 notes that projections based on historical data may not be sufficiently protective, and suggests adding an uncertainty factor. For example, planning for the drought of record may no longer be sufficient, given the possibility of back-to-back drought periods that do not allow time to replenish regular and emergency supplies.

3. Assess Options for Balancing Supply and Demand

This step focuses on two general types of drought mitigation options: reducing customer demand and augmenting supply. It involves identifying a range of demand reduction and supply augmentation options to address shortage scenarios.

Demand Reduction: Ideally, a demand reduction program during a drought will draw on tools, programs and experience developed through an existing year-round Water Conservation Program, which is described above in Action 1. Demand reduction actions during a drought should be intensified as drought levels increase as part of a Staged Drought Response Program (see step 5 below).

Numerous demand reduction examples are provided in M60 and the MA Water Conservation Standards ranging from conservation pricing to setting emergency rationing allocations. Here we highlight 10 actions that represent a range of options for inclusion in a Staged Demand Reduction Program. Some of these actions represent good practices for water conservation every day and could be part of the year-round Water Conservation Program. However, at a minimum, an appropriate combination of these actions should be implemented under drought conditions to address projected shortfalls.

1. Adopt and implement the state's nonessential outdoor water use restrictions as outlined in section 8.2 or a more updated version developed by EEA.
2. Communicate need for and importance of drought response actions (e.g., to ensure adequate water for fire protection and drinking water). Evaluate and utilize all appropriate means of communication.
3. Limit or prohibit: installation of new sod, seeding, and/or landscaping; watering during or within 48 hours after measurable rainfall; washing of hard surfaces (sidewalks, patios, driveways, siding); personal vehicle or boat washing; operation of non-recirculating fountains; filling of swimming pools, hot tubs, and backyard informal rinks.
4. Promote or offer loans or rebates for removal of high-water-use plants and sod, and replacement with less water-intensive vegetation.
5. Provide incentives for installing efficient irrigation technologies.
6. Provide assistance with installation of water-efficient fixtures and appliances, and leak repair.
7. Implement or increase incentives for indoor and/or outdoor water audits.

8. Implement drought surcharge or seasonal water rates.
9. Establish water-use reduction targets for all water users.
10. Identify top water users and conduct targeted outreach to help curb their use.
11. Enforce water-use restrictions with increasingly stringent penalties.

Supply Augmentation: M60 classifies methods of supply augmentation into three groups:

- (1) Your Sources: increase existing supplies, draw from reserve supplies, or develop new supplies for redundancy and/or to serve as a backup during drought;
- (2) Efficiency: increase supplier water use efficiency through a water loss control program; and
- (3) Other Sources: cooperate with other agencies (water purchases, transfers, and interconnections to supplement local supplies and/or provide for emergency connections).

Examples within each group are provided in M60, along with the guidance that even minimal supply augmentation programs, while they may be difficult and time consuming to establish, have been helpful in water-shortage situations.

4. Establish Triggering Levels

This step identifies the specific conditions that will trigger each of the drought levels. First, the number of drought levels must be chosen. DMPs often have three to five drought levels or stages that reflect the severity of conditions and associated actions. The number of drought levels will depend on a number of factors, such as the number of times different actions or different levels of actions are desired in response to worsening conditions. However, there should not be so many drought levels that levels change too frequently for actions to be adjusted by municipal staff and the public. Once the number of levels is decided, setting triggers for each level would include:

- Identifying indicators for drought conditions (e.g., precipitation, groundwater depths, reservoir levels, streamflow);
- Determining values for each indicator that define increasing levels of drought; and
- Establishing a monitoring plan for the indicators including potentially increasing frequency of monitoring during a drought.

In addition to reviewing M60, please follow Massachusetts-specific guidance for Public Water Suppliers presented in Appendix H.

5. Develop a Staged Drought Response

In this step, each drought level or stage is assigned response actions. Specifically, the plan should establish water savings goals for each drought level tied to the anticipated supply shortfalls, and identify actions that will achieve those savings. Information from Steps 3 and 4 will inform the actions and the levels of the actions that are necessary for each drought stage. The example in Table 12 shows how coordination, demand reduction, supply augmentation, and communication actions could be organized in an overall staged response matrix in your plan. A complete drought response matrix would include additional actions for each category.

Table 12: Example Staged Drought Response Matrix*

		STATE DROUGHT LEVEL and DESCRIPTION			
		Level 1:	Level 2:	Level 3:	Level 4:
ACTIONS		MILD DROUGHT	SIGNIFICANT DROUGHT	CRITICAL DROUGHT	EMERGENCY DROUGHT
Reservoir Trigger(s)		Fill in if using local reservoir triggers for staged drought response			
Groundwater Trigger(s)		Fill in if using local groundwater triggers for staged drought response			
Coordination	Drought Management Team (DMT)	Convene Monthly DMT Meetings	Biweekly or weekly DMT Meetings	Weekly or Daily DMT Meetings	Daily DMT Meetings
Demand Management	Nonessential Outdoor Watering	1 day per week watering, before 9 am and after 5 pm.	Hand-held watering only, before 9 am and after 5pm	No nonessential outdoor water use	No nonessential outdoor water use
	New sod, seeding, and landscaping	Follow best management practices for efficient watering.	Installation of new sod, seeding, and landscaping is discouraged	Installation of new sod, seeding, and landscaping is strongly discouraged.	Installation of new sod, seeding, and landscaping is prohibited.
	Water Savings Goal	reduce use by __%	reduce use by __%	reduce use by __%	reduce use by __%
Water Supply Augmentation	Interconnections/Backup and Emergency Supplies	Review/test backup supplies	Prepare for/ possible activation of backup supplies	Possible activation of backup supplies	Activate backup supplies
Communication	Website/Press/Social Media	Update website and social media with latest information on drought status and restrictions/tips	Weekly Tweets on Water Conservation	Press Events and Weekly or Daily Social Media Updates	Daily Communication using all tools

*A complete drought response matrix would include additional actions for each category

6. Adopt the Plan

The adoption of the plan should formalize all plan elements and cooperative arrangements. This step includes engaging the community, preparing a revenue management program, formalizing cooperative agreements, and reviewing and finalizing the plan.

Engage the Community: M60 emphasizes that involvement of customers is critical to create a program that the community understands, contributes to, and supports. Opportunities to engage should include presenting a draft plan at several community forums and making the plan available for public review.

Prepare a Revenue Management Program: Reduction in water use can result in a revenue shortfall if your rates and budget do not have a mechanism to minimize or avoid such shortfall. Therefore, it is important to include financial planning as part of developing your drought plan. M60 describes several ways of balancing costs and revenues, including modifying water rates, adding a water shortage surcharge, and tapping financial reserves (such as those in a general or water revenue fund or a water shortage emergency account. M60 Table 6-2 shows an example budget worksheet projecting the financial effects of four stages of a drought program and discusses options for keeping the budget balanced.

Formalize Cooperative Agreements: This step includes adopting any draft ordinances or interagency/inter-municipal agreements that are part of your plan. Confirming agreements can take time, so it is best done in advance to enable rapid response during an emergency.

Review and Finalize Plan: M60 strongly recommends that the plan be subjected to a formal public review process to help minimize future objections when mandatory provisions are needed. This should include several public meetings following sufficient public notice.

7. Implement the Plan

At this point, all staffing needs, budget and funding considerations should be resolved. M60 provides several helpful checklists that outline categories of resources needed for implementation (such as office space, staff levels and budget, and customer assistance) and provides an example of specific drought implementation program needs for a community of 75,000 people.

Once the plan is adopted, it should be periodically reviewed to ensure that it meets its objectives. In addition, review should be completed if significant changes occur (e.g., in demand, supply, operations) or results during a drought are not satisfactory.

8.2 Community Drought Response Actions

Local authorities that may be involved in drought management include municipal governments, water suppliers, local public safety, local and regional health authorities, local planning boards and conservation commissions, Tribal Councils and other regional agencies with responsibilities for water. During a drought, the general roles and responsibilities of local authorities may include the following:

- Gathering available drought information for the community and identifying information gaps
- Identifying vulnerable aquatic ecosystems
- Implementing all aspects of the local drought plan (Section 8.1, Action 2), and the water conservation program (Section 8.1, Action 1)
- Targeting water management needs
- Managing community water supplies
- Providing timely information to the public about water supplies, low stream flows, projected flow levels without water conservation efforts, public health risks, and drought conditions
- Communicating with the appropriate state agencies in the coordination of drought response
- Coordinating with local water agencies/suppliers to ensure local systems can provide water sufficiently to meet public health and safety needs

- Ensuring local emergency response plans include plans for responding to droughts, identifying existing and potential emergency water supplies, and establishing MOUs or emergency contracts for potable drinking water
- Imposing water restrictions and other measures early so that serious deficits, pressure problems or water quality issues are avoided to the greatest extent possible.

The actions in Table 10 also apply to outdoor water users at the community level and represent one of the most effective ways to minimize the impacts of drought on water supply and the environment. Where appropriate and in response to local supply conditions, local governments may impose restrictions more stringent than these.

8.2.1 Local or Regional Water Agencies/Suppliers

- In conjunction with MassDEP and DPU, manage systems to ensure that they can provide water sufficiently to meet public health and safety needs.
- Implement up-to-date emergency response plans.
- Educate the public and elected officials on the need to impose water restrictions and other measures early so that serious deficits, pressure problems or water quality issues are avoided to the greatest extent possible.
- During dry conditions, coordinate with local government to request voluntary reductions in water use and/or declare a local water emergency (either under local bylaw or through petition to the MassDEP) based on the status of local water supplies.

8.2.2 Local Public Health and Safety Agencies

- Coordinate with other members of local government to provide timely information to the public about water supplies, public health risks, water conservation efforts, and drought.
- Communicate with self-supplied households on the status of their water systems and provide technical assistance as needed.
- Communicate with the appropriate state agencies in the coordination of drought response.
- Provide technical assistance as needed.
- Coordinate with local water agencies/suppliers to ensure local systems can provide water sufficiently to meet public health and safety needs.
- Ensure emergency response plans include plans for responding to droughts, identifying existing and potential emergency water supplies, and establishing MOUs or emergency contracts for potable drinking water.

Section 9: Post-Drought Actions

Following the end of a drought, emphasis should shift to maintaining the resources affected and to applying the lessons learned to improve long-term water sustainability. Tasks include:

- The DMTF recommends an end to existing drought recommendations and notes return to Normal Conditions, Level 0.

- The state continues to monitor hydrological conditions and maintains the long-term monitoring network.
- Water suppliers should restore operations and ensure that drought-driven systems improvements and modifications are in compliance with relevant standards.
- State and federal data and information providers may review the effectiveness of systems to monitor and characterize stream flows, reservoir levels, and groundwater levels during the drought and implement any identified improvements.
- The Drought Management Mission Group, the DMTF, and other involved parties should hold an After Action Review (AAR) to assess the equity, efficiency and effectiveness of communications, information, actions and monitoring that were undertaken. Lessons learned should be documented. This might result in recommended improvements to:
 - Local Drought Management Plans
 - Terms of reference for the Drought Management Mission Group and the DMTF
 - The Massachusetts Drought Management Plan
 - Other state policies, guidelines, and fact sheets
 - Amendments to state legislation and municipal bylaws
- All entities revisit water conservation strategies and reduction targets.
- All entities work to continuously improve water-use efficiency.

Section 10: Drought and Emergency Declarations: Legal Authorities and Powers

The following section discusses the local, state, and federal authorities and powers related to drought situations. This section provides a general summary of the laws applicable to drought issues. However, the appropriate legal staff should be consulted in advance of the use of any of these powers by a state agency or municipal government.

10.1 Local Government

Municipal governments are critically important to managing drought, assessing the impact of drought conditions, and using their authority to respond to the impacts.

- Municipalities are authorized to adopt and implement bylaws or ordinances in appropriate circumstances such as during a drought.
- Municipalities with established water supply or distribution systems may regulate through such bylaws or ordinances the use of water from the municipal system, including voluntary or mandatory water-use restrictions.
- When determined by MassDEP that an emergency exists in the case of a drought or disaster, a municipality may, following appropriate notice, regulate or otherwise restrain the use of water on public or private property (regardless of whether the supply source is public or private) pursuant to G.L. c. 40, § 41A, even in the absence of an established bylaw or ordinance. Additionally, once a state of water emergency is declared and MassDEP has approved a plan to address the emergency, the operator of the public water system may take

by eminent domain the right to use any land for the time necessary to use water on the land for addressing the emergency. M.G.L. c. 21G, § 16. (See section 10.2.3 for more detail.)

- Municipalities, particularly those that experience chronic water shortages, are encouraged to promulgate bylaws or ordinances to address necessary rules for responding to an actual or threatened drought condition. A model water-use restriction bylaw is provided in Appendix I of this plan.

In the event of a declared emergency, a municipality may, generally, raise, appropriate, and expend money for the purposes of maintaining, distributing, and providing at reasonable rates a sufficient supply of the common necessities of life, which include water.

10.2 State Government

The Commonwealth has several established authorities related to responding to drought conditions. The legislature has placed the primary statutory-based drought management authorities at the disposal of the Governor and the MassDEP.

10.2.1 Governor-Declared State of Emergency

Chapter 639 of the Acts of 1950, as amended by Chapter 425 of the Acts of 1958, (the “Civil Defense Act” or “CDA”) allows the Governor to proclaim a state of emergency to address certain conditions in all or in any part of the Commonwealth. When it may be reasonably anticipated that the health, safety or property of the citizens will be endangered, the Governor may declare the existence of such an emergency situation due to a shortage of water resulting from an absence of rainfall or from the occurrence of a disaster or catastrophe of natural causes. CDA, Section 5. A proclamation of such a state of emergency provides the Governor with expansive power, authority and discretion to address and resolve the declared emergency.

During a state emergency, section 5(a) of the CDA authorizes the Governor to employ every agency and the members of every department to protect the lives and property of the citizens and to enforce the law. Under section 5(b) of the CDA, the Governor may, in the event of a disaster or shortage that makes such action necessary for the protection of the public, take possession of land and many types of personal property. The owner of any such property taken, however, is entitled to reasonable compensation for its value. Section 7 of the CDA allows the Governor “to exercise any and all authority over persons and property, necessary or expedient for meeting the state of emergency,” including for example, policing, protecting or preserving all property, public or private. The Governor also has and can exercise authority over the “maintenance, extension or interconnection of services of public utility or public-service companies, including public utility services owned or operated by the commonwealth or any political subdivision thereof.” This broad authority should provide the Governor the power to take necessary steps, such as restraining the use of water on private property, to address an actual or threatened drought.

In addressing threatened disaster such as a water shortage, pursuant to section 4 of the CDA, the Governor has the authority to cooperate with federal authorities and other states, propose a comprehensive plan and program, conduct studies and surveys, ascertain the capabilities of the Commonwealth, and delegate any such administrative authority provided to him under the Civil

Defense Act. Finally, pursuant to Section 8 of the CDA, the Governor may exercise, any power conferred under the CDA, either under an actual proclamation of a state of emergency or in reasonable anticipation of such a proclamation, by issuing executive orders or promulgating regulations.

10.2.2 Massachusetts Emergency Management Agency

MEMA is responsible for direction and control of all state emergency operations as outlined in Chapter 639, Acts of 1950. The Massachusetts Comprehensive Emergency Management Plan (CEMP) is the framework for managing preparedness, response, recovery and mitigation actions at all levels of government in the Commonwealth. Utilizing the CEMP, MEMA coordinates state, federal, and private resources with regard to planning, response and recovery activities.

In the event a declaration of a state of emergency is warranted as a result of drought conditions, the CEMP is the framework for response and recovery actions. Executive Order 144, issued in 1978 to facilitate planning for, and operations during disasters and emergencies, requires state agencies to designate liaison officers to MEMA for the purposes of coordinating resources, training and operations. MEMA is authorized to deploy the resources which their organizations can provide to local governments during emergencies or disasters. A list of the agencies and their responsibilities is available in the CEMP.

10.2.3 Department of Environmental Protection

MassDEP's authority for addressing water supply shortage emergencies is derived from the Water Management Act, M.G.L. c. 21G, §§ 15-17, and from M.G.L. c. 111, § 160, related to ensuring the provision of safe drinking water.

Any operator of a public water system, such as a municipality, water company or other public agency, may petition MassDEP to declare a state of water emergency. M.G.L. c. 21G, § 15. In declaring such a state, MassDEP must find that "there exists or impends a water supply shortage of a dimension which endangers the public health, safety or welfare." MassDEP must limit the applicability of the state of water emergency to the petitioning municipality or to the area served by the petitioning public water supplier, whichever the case.

In declaring a state of water emergency, MassDEP may require the operator of the public water system to submit a plan, which must be approved by MassDEP, designed to address and resolve the emergency. This plan may include provisions for shutting off water on public or private property, and MassDEP may further require the following: (1) an approved water resources management plan; (2) a leak detection program; (3) a program for auditing water use; (4) a program for overall system rehabilitation; (5) conservation programs for public and private buildings; (6) bans or restrictions on certain water uses; (7) a moratorium on the issuance of building permits; (8) a plan for establishing priority for distribution of water among competing uses; and, (9) drought management or contingency plans.

Once a state of water emergency is declared and MassDEP has approved a plan to address the emergency, the operator of the public water system may take by eminent domain the right to use any land for the time necessary to use water on the land for addressing the emergency. M.G.L. c. 21G, § 16. In the case of a water emergency affecting the MWRA system, DCR, rather than MWRA, has such eminent domain authority. This eminent domain authority is narrower than that which the Governor may exercise following a declaration of a state of emergency under the Massachusetts Civil Defense Act, M.G.L. c. 639 (“CDA”). Further, any such taking by eminent domain must be authorized by MassDEP and, except in the case of a private water company, the municipality in which the proposed taking will occur. Water companies must give notice to the affected municipality.

During a state of water emergency, MassDEP may issue orders, applicable within or outside the affected area of the water emergency, to: (1) establish priorities for the distribution of any water or quantity of water use; (2) permit any person engaged in the operation of a water supply system to reduce or increase by a specified amount or to cease the distribution of that water; to distribute a specified amount of water to certain users as specified by the department; or to share any water with other water supply systems; (3) direct any person to reduce, by a specified volume, the withdrawal or use of any water; or to cease the withdrawal or use of any water; (4) require the implementation of specific water conservation measures; and, (5) mandate the denial, for the duration of the state of water emergency, of all applications for withdrawal permits within the areas of the Commonwealth to which the state of water emergency applies.

MassDEP is also granted broad powers to protect the public health through the oversight of water supplies as provided in M.G.L. c. 111, § 160. This section gives the Department the ability to “...make rules and regulations and issue such orders as in its opinion may be necessary to prevent the pollution and to secure the sanitary protection of all such waters used as sources of water supply and to ensure the delivery of a fit and pure water supply to all consumers.” Violation of orders, rules or regulations made pursuant to this statute are punishable by either fines of up to \$25,000 per day for each day a violation occurs or by imprisonment for not more than one year, or both; or by a civil penalty up to \$25,000 per day for each day a violation occurs.

10.2.4 Massachusetts Water Resources Authority

The MWRA, which serves the water needs of many municipalities in the metropolitan Boston area, is generally authorized to develop programs, procedures and regulations for water conservation, leak detection and repair. M.G.L. c. 92 App., § 1-8(m) (1998). Such programs and regulations may also provide for “water use limitations in the time of drought or other emergency.” With respect to water emergencies, MWRA and its communities have the power to provide connection and supply to adjoining communities under an order from MassDEP with appropriate compensation to MWRA. Section 8 (d). This is parallel to MassDEP's powers under c. 21G, but does not go beyond them. Further, in an emergency situation, MWRA is authorized to incur expenses in excess of those shown in its annual budget. M.G.L. c. 92 App., § 1-8(b) (1998).

The MWRA has developed a drought management plan for its system that is tailored to the capacity of its system. The MWRA has daily on-line tracking of its system, including reservoir levels and system demand, as well as sophisticated modeling ability to predict the ability of the MWRA system to meet short- and long-term demands. See the MWRA drought management plan for more details.

MWRA is charged with promoting water conservation, protecting the adequacy of a pure water supply and improving environmental quality under M.G.L. c. 92 § 8(e) and has general authority to promote leak detection and water conservation through its regulations, charges and other programs under Section 8(m). Section 8(m) specifically includes water use limitations in time of drought or other emergency.

10.2.5 Department of Public Health

The Department of Public Health (DPH) has broad authority over matters affecting public health and is mandated to “take cognizance of the interests of life, health, comfort and convenience among the citizens of the commonwealth.” M.G.L. c.111 § 5. DPH is specifically mandated to “conduct sanitary investigations and investigations as to the causes of disease...” M.G.L. c. 111 § 5. With regard to water quality, MassDEP is required to report to DPH any violations of MassDEP regulations relating to drinking water quality standards and, based upon that report or upon its own investigation, DPH may order the appropriate party to cease violating the water quality standards and take whatever steps are necessary to purify the water. If any such order of DPH conflicts with any order of MassDEP, the order of DPH takes precedence. M.G.L. c. 111 § 160B. MassDEP regulations require MassDEP to report to DPH all violations of MassDEP drinking water regulations and to consult with DPH with regard to enforcement actions taken to obtain compliance with MassDEP drinking water regulations 310 CMR 22.03(4).

In addition, pursuant to M.G.L. c. 111 §127A, DPH has promulgated State Sanitary Code Chapter II, entitled Minimum Standards of Fitness for Human Habitation, which requires all owners of residential dwellings to provide a potable water supply. 105 CMR 410.180. Local boards of health have primary authority to enforce the sanitary code requirements, but DPH may enforce these regulations if the local board of health fails to act.

10.2.6 Department of Public Utilities

The DPU’s authority for addressing water supply emergencies is derived from M.G.L. c. 25, § 4B. Upon declaration of a state of emergency by the governor, the governor may authorize the chair of the DPU to take such action that the chair may consider necessary to assure public safety and welfare through the priority restoration or continuing availability of gas, electric, and water utility services. Under such authority, the chair may issue operational and management directives and order expenditures or other measures by any investor-owned utility that the chair considers necessary to respond to the state of emergency. Any orders issued by the chair shall expire within 30 business days unless ratified by the commission prior to the 30-day expiration; provided, however, that said ratification by the commission shall prescribe an end date for each order. Failure of any investor-owned utility to carry out an order by the chair authorized under this section shall be subject to investigation and a penalty

of up to \$1,000,000 per violation, with any such penalty levied to be returned to ratepayers through distribution rates.

Section 11: Plan Update and Maintenance

This plan is considered a living document and may be updated and revised based on experiences. Changes may be made based on the approval of the Massachusetts Drought Management Task Force and in consultation with the Massachusetts Emergency Management Agency (MEMA). Notices of change will be distributed by the Executive Office of Energy and Environmental Affairs.

This plan will be posted with the Massachusetts Comprehensive Emergency Management Plan on the MEMA website. The plan will also be posted on the websites of the Executive Office of Energy and Environmental Affairs (EEA). If interested parties are unable to obtain the document from these websites, requests must be coordinated through MEMA or EEA.

Appendix E: List of Massachusetts Towns by Drought Region

-- Under Development --

Appendix F: Private Wells - Frequently Asked Questions

How can the drought impact drinking water sources?

During periods of drought, especially when conditions are severe (Level 2-Significant Drought and higher), water sources such as reservoirs and wells that draw from underground aquifers are slow to recharge and can drop to very low levels. As the drought persists, these levels continue to decrease significantly and can affect all water users.

Does my small private well have any impact on water levels?

All sources of water that are within a river basin, irrespective of the location or type of withdrawal, ultimately get their water from that same basin. The impact from your private well withdrawal along with all others in the watershed does impact the total amount of water available in that basin. During a drought, with less water available the impacts will be felt by all. Overuse of water, especially for outdoor purposes, will deplete sources.

Will my efforts to conserve water make any difference?

No matter where you get your water, any water conservation efforts you take will help alleviate the impacts on your source of water. Being mindful of the amount of water you use, and follow the same watering restrictions as your town's public water supply system to help stretch your water supplies until conditions improve. It will also allow your community to have enough water for fire protection (the likelihood of fires increases as conditions get dry), public health and safety, and the environment. ***So remember, even if you have your own well, it almost always still comes from the same place as the public water supply, as long as you are in the same river basin. Water conservation measures are critical and should be started early. Reducing your water use can save water for the future!***

How can I get more Information about my well?

If you are looking for more information about your well, contact your local Board of Health (BOH). Upon installation of any well, a well driller is required to submit copies of the Well Completion Report to the local BOH and the MassDEP Well Driller Program. By contacting either office, you should be able to get a copy of your Well Completion Report, which contains well construction details and geologic descriptions.

If I am a private citizen and my well goes dry what should I do?

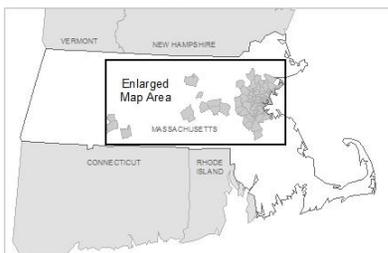

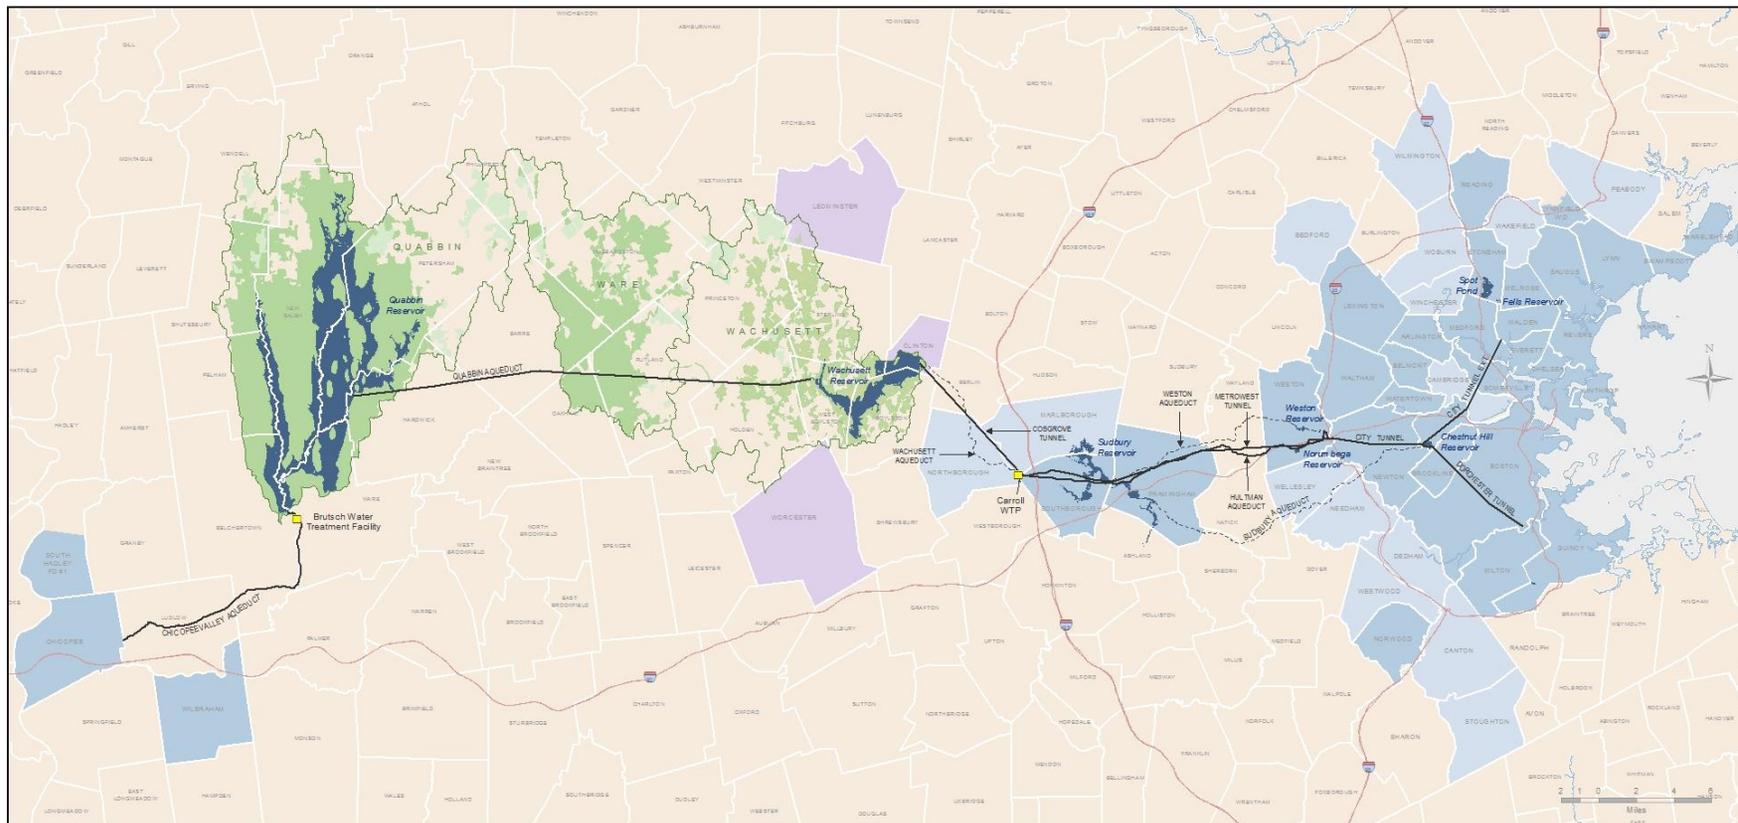

- First contact your town office, your local Board of Health and emergency management official to report your dry well and to determine if there are any local resources available for assistance.
- If you need immediate hook-up to a water connection, contact your local fire department and/or school to see if you may be able to use their facilities.
- If you have enough storage available at your residence, you may also be able to buy water from private water suppliers and tankers. For a list of vendors, click [here](#).

- For a long-term solution, contact a well digger to explore options such as well replacement, deepening the well to access water lower into the water table. For more information on well drilling visit the MassDEP website on private wells [here](#).

If I am a small business or a farmer with a private well that is running dry what should I do?

- Contact your local city or town office, and Board of Health to report that your well is going dry.
- A farmer may contact Massachusetts Department of Agricultural Resources for assistance.
- If you have enough storage available at your farm, you may also be able to buy water from private water suppliers and tankers. For a list of vendors, click [here](#).

Appendix G: MWRA Water Supply Communities – Full and Partially Served

Date: 9/26/2018

MwraGIS 1454.7

Appendix H: MassDEP Model Water Use Restriction Bylaw/Ordinance

DEP STRONGLY ADVISES YOU TO CONSULT WITH YOUR TOWN OR CITY COUNSEL TO ENSURE ADOPTION OF AN APPROPRIATE, ENFORCEABLE AND LEGALLY VALID BY-LAW THAT WILL MEET YOUR MUNICIPAL AND/OR DISTRICT NEEDS.

The terms “town” and “bylaw” used throughout this document are intended also to refer to cities and ordinances, respectively. References to Boards of Water Commissioners throughout this model bylaw should be edited by particular cities and towns or water districts or boards to accurately describe the municipal department or water district or board having authority and responsibility for the operation and maintenance of the public water supply.

2018 DEP MODEL OUTDOOR WATER USE BY-LAW/ORDINANCE

Includes optional language for specific restrictions during drought, regulating private wells and/or inground irrigation systems

Section 1: Authority

This By-law is adopted by the Town [or Water District]¹⁷ under its police powers pursuant to the Home Rule Amendment of the Massachusetts Constitution, Article LXXXIX, to protect public health and welfare and pursuant to its powers under M.G.L. c. 40, §§ 21 *et seq.* and implements the Town’s authority to regulate water use pursuant to M.G.L. c. 41, § 69B. This by-law also implements the Town’s [or Water District’s] authority under M.G.L. c. 40, § 41A, conditioned upon a declaration of water supply emergency issued by the Department of Environmental Protection under G.L. c. 21G, §§ 15-17. This by-law is also intended to implement other water conservation requirements of M.G.L. c. 21G, the “Massachusetts Water Management Act” and its regulations promulgated at 310 CMR 36.00.

Section 2: Purpose

The purpose of this by-law is to protect, preserve and maintain the public health, safety, welfare and the environment whenever there is in force a “State of Water Supply Conservation”, a “State of Drought” or a “State of Water Supply Emergency” by ensuring an adequate supply of water for drinking and fire protection and to protect the quality and quantity of water in local aquatic habitats such as ponds, rivers and wetlands. This purpose will be accomplished by providing for the imposition and enforcement of any duly implemented restrictions, requirements, provisions or conditions on water use imposed by the Town [or Water District] in accordance with this by-law and/or by the Department of Environmental Protection under its state law authorities.

Section 3: Applicability

All Town [or Water District] residents that are customers of the public water supply system [and private well users (see footnote 3)] shall be subject to this by-law. This by-law shall be in effect year round.

¹⁷ If the public water supplier in the city or town is an independently authorized entity having its own legislative authority, that authority should be cited in this section rather than the municipal statutory authorities. See also, M.G.L. c 40N “Model Water and Sewer Reorganization Act”. The citation to M.G.L. c. 40, § 41A (“Restraint of Use of Water During Emergency”) should, however, be retained for both municipal authorities and districts. Both municipal entities and independent entities will be referred herein as “the Town or Water District”.

Section 4: Definitions

Agriculture, shall mean farming in all its branches as defined at M.G.L. c. 128, § 1A.¹⁸

Automatic irrigation system, including sprinklers, shall mean any system for watering vegetation other than a hand-held hose or a bucket.

Nonessential outdoor water use shall mean those uses that are not required:

1. for health or safety reasons;
2. by regulation;
3. for the production of food and fiber;
4. for the maintenance of livestock; or
5. to meet the core functions of a business.

Nonessential outdoor water uses that are subject to mandatory restrictions include:

- irrigation of lawns via sprinklers or automatic irrigation systems;
- washing of vehicles, except in a commercial car wash or as necessary for operator safety or to prevent damage and/or maintain performance of agricultural or construction vehicles or equipment; and
- washing of exterior building surfaces, parking lots, driveways or sidewalks, except as necessary to apply paint, preservatives, stucco, pavement or cement.

Exceptions to nonessential outdoor water uses are:

- irrigation of lawns, gardens, flowers and ornamental plants by means of a hand-held hose controlled by a nozzle or a drip-irrigation system; and
- irrigation with harvested and stored stormwater runoff.

The following outdoor water uses are subject to review and approval by The Town [or Water District], through its Board of Water Commissioners [or Selectmen or Water District Commissioners] or their designee:

- irrigation of public parks and recreation fields outside the hours of 9 AM to 5 PM;
- irrigation to establish replanted or resodded lawn or plantings during the months of May and September;
- irrigation of newly planted lawns (seeded or sodded) in the current calendar year for homes or businesses newly constructed in the previous twelve months; and
- filling of privately owned outdoor pools.

Person shall mean any individual, corporation, trust, partnership, association, agency or authority, or other entity and any officer, employee, group or agent of such persons.

¹⁸ This statutory definition includes cultivation of the soil, dairying and the production, cultivation, growing and harvesting of agricultural, aquacultural, floricultural or horticultural commodities as well as forest harvesting, raising livestock inclusive of bees and fur-bearing animals and forestry, lumbering, preparation for market, delivery to storage or market or to carriers to market incidental to an agricultural operation.

State of Drought shall mean a Drought Advisory, Watch, Warning or Emergency declared by the Secretary of Energy and Environmental Affairs in consultation with the Massachusetts Drought Management Task Force.

State of Water Supply Emergency shall mean a State of Water Supply Emergency declared by the Department of Environmental Protection under M.G.L. c. 21G, §§ 15-17.

State of Water Supply Conservation shall mean a State of Water Supply Conservation declared by the Town [or Water District] pursuant to Section 5 of this by-law.

Water Customers shall mean all persons using the public water supply irrespective of that person's responsibility for payment for use of the water.

Water Users shall mean all persons using the public water supply or using privately-owned wells within the Town [or Water District] boundaries.¹⁹

Section 5: Declaration of a State of Water Supply Conservation

The Town [or Water District], through its Board of Water Commissioners [or Selectmen or Water District Commissioners] or their designee authorized to act as such:

- a) may declare a State of Water Supply Conservation upon a determination that conservation measures are appropriate to ensure an adequate supply of water for drinking and fire protection, to protect the quality and quantity of water in local aquatic habitats such as ponds, rivers and wetlands; and
- b) shall declare a State of Water Supply Conservation as necessary to ensure compliance with the Water Management Act.

Upon notification to the public that a State of Water Supply Conservation has been declared, no water customer [water user] shall violate any provision, restriction, requirement or condition of the declaration. The Water Commissioners may designate the [Water Department Superintendent, Town Manager, DPW Director] to declare a State of Water Supply Conservation at any time that conditions warrant. Public notice of a State of Water Conservation shall be given under Section 9 of this by-law before it may be enforced. The applicable restrictions, conditions or requirements shall be included in the public notice.

¹⁹ This model by-law has been drafted to provide the option for a Town or Water District to capture the use of privately-owned wells for nonessential outdoor water use. If you do not intend to include privately-owned wells, strike the "water users" definition and replace the term "water users" with "water customers" wherever applicable.

If you intend to include privately-owned wells during times of drought only, include the definitions of both "water customers" and "water users", and use the terms as applicable. If you intend to include both water supply system customers and private well users at all times, strike the "water customers" definition and use the term "water users" throughout.

Section 6: State of Drought²⁰

Upon notification to the public that a State of Drought has been declared, no water customer [water user] shall violate any provision, restriction, requirement or condition of the Town's [Water District's] water use restrictions. Public notice of a State of Drought shall be given under Section 9 of this by-law before it may be enforced. The applicable restrictions, conditions or requirements shall be included in the public notice.

Section 7: Declaration of a State of Water Supply Emergency

Upon notification to the public that a declaration of a State of Water Supply Emergency has been issued by the Department of Environmental Protection, no person shall violate any provision, restriction, requirement, condition of any order approved or issued by the Department for the purpose of bringing about an end to the State of Water Supply Emergency. Public notice of a State of Water Supply Emergency shall be given under Section 9 of this by-law before it may be enforced. The applicable restrictions, conditions or requirements shall be included in the public notice.

Section 8: Restricted Water Uses²¹

A declaration of a State of Water Supply Conservation, State of Drought or State of Water Supply Emergency shall include one or more of the following restrictions, conditions, or requirements limiting nonessential outdoor water use by water customers (water users) as necessary to control the volume of water pumped each day, except as provided as acceptable in Section 4. The applicable restrictions, conditions or requirements shall be included in the public notice required under Section 9.

- a) Nonessential outdoor water use days: Nonessential outdoor water use is permitted only on the days per week specified in the State of Water Supply Conservation, State of Drought or a State of Water Supply Emergency and public notice thereof. During a State of Water Supply Conservation, nonessential outdoor water use is restricted as necessary to ensure compliance with the Water Management Act, or for a Town or Water District without a Water Management Act permit, to two days or fewer per week.
- b) Nonessential outdoor water use hours: Nonessential outdoor water use is permitted only during the hourly periods specified in the State of Water Supply Conservation, State of Drought or State of Water Supply Emergency and public notice thereof. At a minimum, nonessential outdoor water use is prohibited during the hours from 9AM to 5PM.
- c) Nonessential outdoor water use method restriction: Nonessential outdoor water use is restricted to a bucket or hand-held hose controlled by a nozzle.
- d) Nonessential outdoor water use ban: Nonessential outdoor water use is prohibited at all times.

²⁰ Section 6: State of Drought has been included in this model by-law to provide the option:

- a) to capture the use of privately-owned wells specifically during times of drought when recharge to municipal water sources may be impacted by private well withdrawals, and/or
- b) to provide the option of instituting more stringent restrictions during times of drought for water customers and private well users through inclusion of additional restrictions in the required Public Notice of a State of Drought.

If you do not intend to institute specific restrictions during times of drought, strike the State of Drought Definition, State of Drought section, and references to "State of Drought" wherever applicable.

²¹ Many Water Management permits include specific language restricting outdoor water uses. Each town, city or district should consult their Water Management permit to ensure consistency with permit requirements.

- e) Automatic irrigation systems, including sprinklers: The use of automatic irrigation systems is prohibited.

Section 9: Public Notification and Notification of DEP

- a) Public Notification of a State of Water Supply Conservation or a State of Drought – Notice to the public of all provisions, including all restrictions, requirements and conditions imposed by the Town [Water District] as part of a State of Water Supply Conservation or a State of Drought shall be made as soon as possible, but no later than 48 hours following the declaration of a State Water Supply Conservation or State of Drought by publication in a newspaper of general circulation within the Town and by signage on major roadways or intersections. Notification may also include email, Web sites, public service announcements on local media, reverse 911 calls or other such means reasonably calculated to reach and inform all water customers [water users].
- b) Public Notification of a State of Water Supply Emergency – Notice to the public of all provisions, including all restrictions, requirements and conditions imposed by a State of Water Supply Emergency declared by the Department shall be made as soon as possible, but not later than 48 hours after the public water system receives notice of the Department’s declaration of a State of Water Supply Emergency, by publication in a newspaper of general circulation with the Town and by signage on major roadways or intersections. Notification may also include email, Web sites, public service announcements on local media, reverse 911 calls or other such means reasonably calculated to reach and inform all water customers [water users] of the State of Water Supply Emergency.
- c) Any restriction imposed pursuant to Section 5 or Section 6 or in the Department’s State of Water Supply Emergency or Order shall not be effective until notification to the public is provided.
- d) Notification of DEP: Submittal of MassDEP’s form “Notification of Water Use Restriction” shall be provided to the Massachusetts Department of Environmental Protection within 14 days of the effective date of the restrictions, per MassDEP regulations (310 CMR 22.15(8)).

Section 10: Termination of a State of Water Supply Conservation; Notice

A State of Water Supply Conservation may be terminated by a majority vote of the Board of Water Commissioners or by decision of their designee upon a determination by either or both of them that the conditions requiring the State of Water Supply Conservation no longer exist, or in accordance with the Water Management Act permit conditions. Public notification of the termination of a State of Water Supply Conservation shall be given in the same manner as is required in Section 9a for notice of its imposition.

Section 11: Termination of a State of Drought; Notice

Upon notification to the Town [Water Commissioners or their designee or to the Water District] that the declaration of a State of Drought has been terminated by the Secretary of Energy and Environmental Affairs, the public will be notified of the termination in the same manner as is required in Section 9a for notice of its imposition.

Section 12: Termination of a State of Water Supply Emergency; Notice

Upon notification to the Town [to the Water Commissioners or their designee or to the Water District] that the declaration of a State of Water Supply Emergency has been terminated by the Department of Environmental

Protection, the public will be notified of the termination in the same manner as is required in Section 9b for notice of its imposition.

Section 13: Penalties

The Town [or Water District] through its Water Commissioners or their designee including the water superintendent, building inspector and/or local police may enforce this by-law. Any person violating this by-law shall be liable to the Town in the amounts listed below:

- 1) First violation: Warning
- 2) Second violation: \$ ____
- 3) Third violation: \$ ____
- 4) Fourth and subsequent violations: \$ _____

Each day of violation shall constitute a separate offense. Fines shall be recovered by complaint before the District Court, or by non-criminal disposition in accordance with section 21D of chapter 40 of the general laws. For purposes of non-criminal disposition, the enforcing person shall be any police officer of the town or the water superintendent or the superintendent’s designee. If a State of Water Supply Emergency has been declared the Water Commissioners may, in accordance with G.L. c. 40, § 41A, shut off the water at the meter or the curb stop.

Section 14: Severability

The invalidity of any portion or provision of this by-law shall not invalidate any other portion or provision thereof.

Section 15: Controls on In-Ground Irrigation Systems²²

Subsection XX.1 Registration and Installation

- a) All new and existing in-ground irrigation systems shall be registered with the Town’s Board of Water Commissioners in such form and manner as they shall determine. A fee may be charged for this registration. Registration fees shall be set by the Board of Water Commissioners.²³ The Board may require inspection of the irrigation system.
- b) All in-ground irrigation systems shall be equipped with a timing device that can be set to make the system conform to the Town’s [or Water District’s] nonessential outdoor water use restrictions. Whenever outdoor water use restrictions are in force, the timing device must be set to conform to the daily and hourly nonessential outdoor water use restrictions.
- c) All in-ground irrigation systems shall be plumbed so that a shutoff valve is located outside the building and situated so that it may be shut off if found to be in violation of this by-law. For the purposes of

²² This section is intended to govern automatic irrigation systems and may be passed as part of a water use restriction bylaw or separately. It is included here for convenience.

²³ Be sure that fees charged avoid characterization as a tax under the principles of Emerson College vs. City of Boston, 391 Mass. 415, 424-426 (1984) by ensuring that they are directly related to and are used to pay for the services provided (inspection, etc.).

this section only, Police Officers of the Town and/or Agents of the Board of Water Commissioners may enter upon any property to enforce this section.²⁴

Subsection XX.2 Soil Moisture-Sensor Devices

- a) All in-ground irrigation systems installed in the Town [or Water District] after the date of effect of this bylaw shall be equipped with a soil moisture-sensor device, approved by the Board of Water Commissioners, to prevent the system from starting automatically when not needed. Proof of this installation shall be provided to the Board of Water Commissioners at the time of registration.
- b) Any service or repair to an existing in-ground irrigation system shall include the installation of an approved moisture-sensor device, if the same is not already installed and in good working condition. Proof of this installation shall be provided to the Board of Water Commissioners at the time of installation.
- c) The Board of Water Commissioners shall maintain a list, available to the public, of approved soil moisture-sensor devices.

Subsection XX.3 Backflow Prevention

- a) All in-ground irrigation systems connected to the municipal water system in the Town [or Water District] shall be protected from backflow events by the installation of a backflow prevention device approved by the Board of Water Commissioners. Each backflow prevention device shall be registered with the Board of Water Commissioners. [A fee may be charged for this registration. Registration fees shall be set by the Board of Water Commissioners.]
- b) The Board of Water Commissioners shall maintain a list, available to the public, of approved backflow prevention devices. Refer to Table 22-1 in 310 CMR 22.22 for the recommended backflow protection for irrigation systems.
- c) Each backflow prevention device shall be installed in accordance with 310 CMR 22.22 and the manufacturer's instructions. Each device shall be tested upon its installation and annually thereafter. A Massachusetts Certified Backflow Device Tester shall perform all testing. Copies of results of all testing shall be filed with the Board of Water Commissioners or Water Department.

²⁴ Depending on the circumstances of a particular case, a warrant may also be required to enter onto private property.

Appendix I: Massachusetts Drought History Summary

Droughts in Massachusetts Based on Instrumental Records

This table reflects only the time period of recorded history going back to the late 1800s. Newby et al. (2014) reconstructed centennial and longer paleohydrologic changes in the Northeastern United States. They concluded that the condition of water resources historically experienced are at high water levels relative to pre-recorded history and there is a low probability of these "wet" conditions remaining at current levels in coming decades and centuries.

Date	Area affected	Recurrence interval (years)	Remarks	Reference
1879-83	-	-		Kinnison (1931) as cited in USGS 1989
1908-12	-	-		Kinnison (1931) as cited in USGS 1989
1929-32	Statewide	10 to >50	Water-supply sources altered in 13 communities. Multistate.	USGS 1989
1939-44	Statewide	15 to >50	More severe in eastern and extreme western Massachusetts. Multistate.	USGS 1989
1957-59	Statewide	5 to 25	Record low water levels in observation wells, northeastern Massachusetts.	USGS 1989
1961-69	Statewide	35 to >50	Water-supply shortages common. Record drought. Multistate.	USGS 1989
1980-83	Statewide	10 to 30	Most severe in Ipswich and Taunton River basins; minimal effect in Nashua River basin. Multistate.	USGS 1989
1985-88	Housatonic River basin	25	Duration and severity as yet unknown. Streamflow showed mixed trends elsewhere.	USGS 1989
1995	-	-	Based on statewide average precipitation	DMP 2013
1998-1999	-	-	Based on statewide average precipitation	DMP 2013
Dec 2001 - Jan 2003	Statewide	-	Level 2 drought (out of 4 levels) was reached statewide for several months	DCR 2017
Oct 2007 - Mar 2008	Statewide except West and Cape & Islands regions	-	Level 1 drought (out of 4 levels)	DCR 2017
Aug 2010 - Nov 2010	Connecticut River Valley, Central and Northeast regions	-	Level 1 drought (out of 4 levels)	DCR 2017
Oct 2014 - Nov 2014	Southeast and Cape & Islands regions	-	Level 1 drought (out of 4 levels)	DCR 2017
Jul 2016 - Apr 2017	Statewide	-	Level 3 drought (out of 4 levels)	DCR 2017

Notes:

- means data is not available

USGS 1989 determined dry periods from streamflow and precipitation records. Dry periods that exceeded a recurrence interval of 10 years were deemed droughts.

DMP 2013 analyzed precipitation data only and as a statewide average of stations.

DCR 2017 compiled data based on historical drought declarations by the state under the protocol in its 2013 Drought Management Plan
